Drill at sowing, first
The seed drill's fertilizer box places the granule about 5 cm beside and below the seed row, never touching the seed. The root meets it first and the whole bag is in the root zone.

Side-dress, second
A band beside the row, by hand or planter, at sowing or the first irrigation, covered with soil.

Broadcast, last
Spread on the surface before the last ploughing or before an irrigation, and mixed in. Most of the bag is away from the root.

Indicative programme. Built on best practice and the nutrient requirement of the crop, per acre. VAN prepares farm-specific plans against your soil analysis, yield target and the other variables that decide a rate: ask for one. Vital Urea is applied by drilling at sowing, side dressing or broadcasting, never by fertigation; the fertigation rows in the nitrogen band are general urea, a different material. Every VAN batch is tested before it ships; the batch number on the bag brings its certificate.

Rows as published on van.com.pk/crops/wheat.html, 27 Sep 2026. Rates are per acre unless marked. Where a row says "Drill at sowing; broadcast if no drill", the drill is first by VAN's order of methods.
