DEALER TRAINING · NOVEMBER 2026

Fusion Phosphate

Triple super phosphate (TSP) with P_2O_5 46% and no nitrogen, in a 50 kg bag, drilled into the ground at sowing.

VAN wrote this deck for its dealers and field team. A dealer can repeat its words to a grower.

THE 30-SECOND EXPLANATION

What a dealer says to a grower in 30 seconds.

Fusion Phosphate is triple super phosphate in a 50 kg bag of granules. It contains 46% P_2O_5 and no nitrogen; 43% of the product's weight is water-soluble P_2O_5. Phosphorus does not move through the soil to the root; the root has to grow to it. So this bag goes into the ground before or at sowing, drilled beside and below the seed row where the equipment allows. As the granule dissolves, it makes the soil water around it acidic, while the surrounding calcareous soil is alkaline. This gives the root a few weeks to reach the phosphate before the soil's calcium binds it. VAN sells 2 phosphate bags for sowing. This one contains phosphate only, at a high concentration. Green Phosphate has a humic coating. The crop plan gives the same number of bags for either, and the grower chooses.

The 4 points it must cover

1. The bag: P_2O_5 46%, no nitrogen, 50 kg, PS 216-2009. 43% of the product is water-soluble P_2O_5. 23 kg of P_2O_5 in every bag.
2. The nutrient: phosphorus builds the root in the first weeks and does not move through the soil. It must be in the ground before or at sowing.
3. The method: drilling at sowing, beside and below the seed, is best. Side-dressing is next; broadcasting is the last option.
4. The choice: Fusion Phosphate or Green Phosphate at land preparation, at the same bag count. VAN states that no trial shows one is better than the other.

Explain the product in simple words a grower uses, and keep to the figures on these slides. Every figure in this 30-second explanation is on the bag, in the published crop plan or in the named evidence on the slides that follow.

THE BAG

What the bag says, and what it is registered as.

50 kg

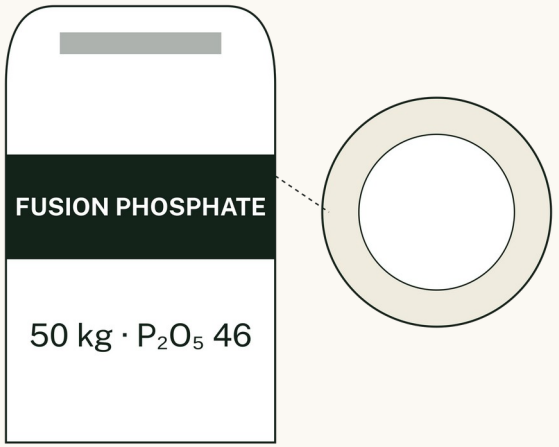

the bag. Every bag holds 23 kg of P_2O_5 by the declared analysis, and no nitrogen.

P_2O_5 46%

total phosphate, declared on the front of the bag. It is the highest analysis of any straight phosphate.

43%

of the bag is water-soluble P_2O_5: 21.5 kg of the 23 kg (the water-soluble figure printed on van.com.pk).

pH 2.5 to 3.5

the pH of the granule in solution, from VAN's product data: acidic, the opposite of the alkaline soil.

1 to 4 mm

granule size, suited to the seed drill's fertiliser box and to even spreading.

LAB 336

every batch is released through VAN Lab, accredited by the Pakistan National Accreditation Council (PNAC), before it ships.

Registered as	Pakistan Standard	Manufacturing licence
Fusion Phosphate	PS 216-2009	CM/L-2942/2023

If a grower asks about registration, give the licence number. Do not give an expiry date for the licence.

A GROWER'S QUESTION

“I put my phosphate in once, at sowing, and never again. Which bag, and what am I actually paying for?”

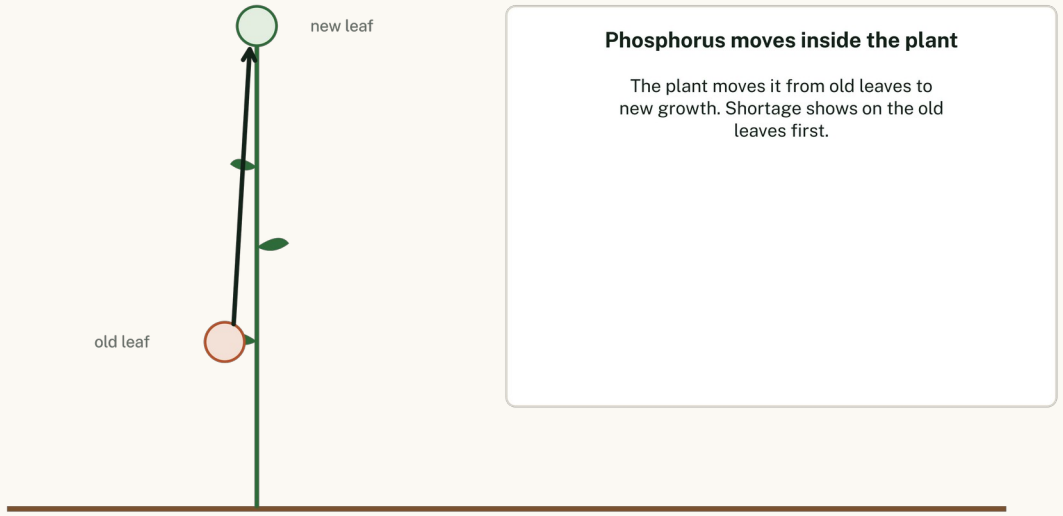

The grower makes 1 application at land preparation and has 2 VAN bags to choose from. He wants to know what is in each, why it goes in before or at sowing, and why the kilograms of P_2O_5 in each bag do not, on their own, decide which to buy. The answer has 3 parts: phosphorus does not move through the soil, each granule keeps the soil around it acidic for a few weeks, and either basal bag may be chosen.

The next 3 slides give the 3 answers, 1 idea on each slide.

ANSWER 1 OF 3

Phosphorus moves only millimetres in the soil, so the root has to grow to it.

Nitrogen moves with the water. Phosphate moves only a few millimetres in the soil, so the root has to grow to the granule. That is why phosphorus is applied at sowing. Phosphorus is needed for root growth in the first weeks, and it affects how many tillers wheat produces and how well the crop sets and fills. If phosphorus is short, most of the damage is done early and cannot be undone later. The roots may never reach phosphate that is spread on a standing crop.

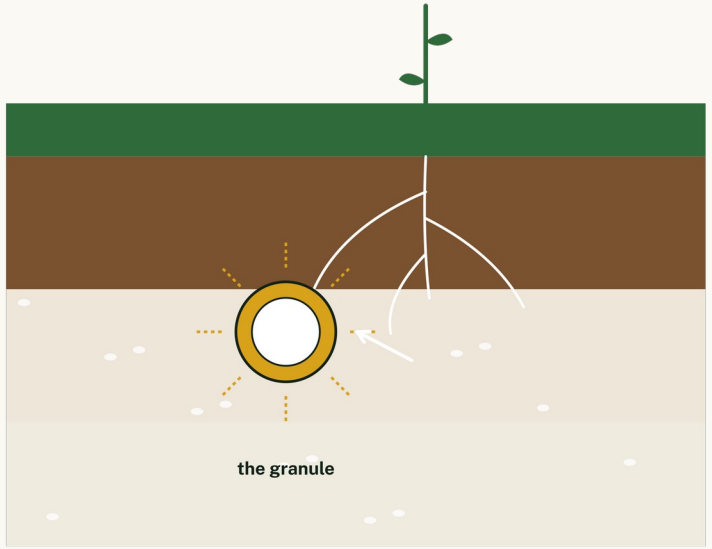

Say it like this: “Phosphorus does not move to the root; the root has to grow to it. So it goes in the ground before or at sowing.”

A mobile nutrient compared with an immobile one. The drawing shows general soil chemistry, not a VAN measurement.

ANSWER 2 OF 3

Each granule keeps the soil around it acidic for a few weeks.

Triple super phosphate is a calcium phosphate made with phosphoric acid. When water reaches the granule it dissolves into a strongly acidic solution, pH 2.5 to 3.5 by VAN's product data. In soil above pH 8 with free lime, dissolved phosphate reacts with calcium within a few centimetres and comes out of solution before the root reaches it. The acidic zone around the granule slows that reaction for the weeks a young root needs to reach it. The zone is a few centimetres wide and lasts a few weeks. It does not change the soil of the whole field, and it will not change a soil test result.

The solution around the granule starts acidic. The acidic zone is a few centimetres wide; it does not cover the field.

Say it like this: "Each granule keeps a small patch of soil acidic for a few weeks, which gives the root time to reach the phosphate. It does not change the whole field or last the whole season."

The chemistry of a superphosphate granule, as textbooks describe it; not a VAN measurement. No figure is given for how much phosphate becomes locked up in the soil ("fixed") or how much is saved.

ANSWER 3 OF 3

The grower may choose either of VAN's 2 basal phosphate bags.

At land preparation the grower may put in Fusion Phosphate or Green Phosphate; the crop plan deliberately gives the same number of bags for either. Fusion Phosphate is the straight bag: 23 kg of P_2O_5, of which 21.5 kg is water-soluble; no nitrogen, no coating. Green Phosphate is the coated bag: 16 kg of P_2O_5 and 3 kg of nitrogen, granulated in an acidic mix and given a humic coating. The 2 bags contain different amounts of nutrient. No trial shows that the crop gets more phosphate from one bag than from the other.

What is in each bag, from the declared analyses. No availability percentage is given, and neither bag is called better.

Say it like this: "Both go in at land preparation, at the same number of bags. Fusion Phosphate is straight phosphate with no nitrogen; Green Phosphate is coated. You choose, and I will tell you what is in each."

THE EVIDENCE

What is verified for Fusion Phosphate, and what is not.

No trial of Fusion Phosphate is on VAN's record. A dealer may state the following as facts, and should say where each comes from: what the bag declares, the standard and licence, the Punjab soil survey and the published soil chemistry.

Item	What it says	How a dealer may use it
The bag	Fusion Phosphate, triple super phosphate, P_2O_5 46%, 50 kg, granular 1 to 4 mm. 43% of the product is water-soluble P_2O_5, as van.com.pk prints it.	As fact.
The standard and licence	Pakistan Standard PS 216-2009 for triple super phosphate; manufacturing licence CM/L-2942/2023.	As fact. The number, never an expiry date.
The Punjab soil survey (770,160 samples, about 2016 to 2018)	69.1% of samples above pH 8; 59.1% of samples below 7 parts per million (ppm) available phosphorus, the level treated as low; 97.9% below 15 ppm, the level treated as adequate; mean 6.62 ppm. The median available phosphorus of 35 of the 36 districts fell in the Critical or Weak band of VAN's soil-test scale.	As fact about the soil. Never as product performance.
The soil chemistry (published)	Above pH 8 with free lime, dissolved phosphate reacts with calcium within centimetres and comes out of solution. The first calcium phosphates formed are still fairly available; the phosphate becomes unavailable as they age into rock-like forms.	As general soil chemistry. Never quote a percentage of phosphate fixed.
Not on VAN's record	A Fusion Phosphate trial; a yield figure; a percentage of phosphate fixed or saved; a Pakistani figure for how far phosphate moves from a granule.	Not said.

Sources: the bag and van.com.pk; the register of the Pakistan Standards and Quality Control Authority (PSQCA) as van.com.pk prints it; the Punjab soil survey (36 district workbooks, 770,160 samples, tested in about 2016 to 2018); Tunesi 1999 and Freeman and Rowell 1981 for the calcium chemistry.

1 bag of Fusion Phosphate costs Rs 15,000 and supplies 23 kg of P_2O_5.

The price is the delivered farmer price from the VAN farmer price sheet, Aug 2026. P_2O_5 is from the declared analysis. The bag contains no other nutrient.

Fusion Phosphate, P_2O_5 46%	Weight	P_2O_5	of it water-soluble	Rupees
1 bag	50 kg	23.0 kg	21.5 kg	15,000
½ bag	25 kg	11.5 kg	10.75 kg	7,500
1.5 bags (the sunflower crop plan)	**75 kg**	**34.5 kg**	**32.25 kg**	**22,500**

A bag holds 23 kg of P_2O_5 and no nitrogen, so all of the grower's nitrogen comes from a separate nitrogen fertiliser. VAN gives no figure for how much of the 23 kg the root reaches; the answer slides explain why.

Fusion Phosphate 50 kg Rs 15,000: the VAN farmer price sheet, Aug 2026. 23.0 kg = 50 × 0.46; 21.5 kg = 50 × 0.43 (the water-soluble figure van.com.pk prints). Sunflower: the crop plans on van.com.pk, 1.5 bags at land preparation.

Per acre, Fusion Phosphate costs Rs 15,000 to Rs 30,000, at 1 to 2 bags.

The sunflower crop plan names Fusion Phosphate. Where a crop plan puts Green Phosphate into the soil, Fusion Phosphate is the alternative, at the same number of bags; it is not offered on fertigation rows. Rupees per acre use the VAN farmer price sheet, Aug 2026.

Crop	Bags per acre	P_2O_5 put in	Rupees per acre	What the crop plan names
Sunflower	1.5 bags of 50 kg	34.5 kg	22,500	Fusion Phosphate, land preparation
Wheat	1 bag of 50 kg	23 kg	15,000	Green Phosphate
Maize	1.5 bags of 50 kg	34.5 kg	22,500	Green Phosphate
Cotton	1.5 bags of 50 kg	34.5 kg	22,500	Green Phosphate
Potato	2 bags of 50 kg	46 kg	30,000	Green Phosphate
Sugarcane	2 bags of 50 kg	46 kg	30,000	Green Phosphate
Basmati rice	1 bag of 50 kg	23 kg	15,000	Green Phosphate

When the grower chooses Fusion Phosphate instead of Green Phosphate, the number of bags stays the same. Each bag of Green Phosphate also carries 3 kg of nitrogen and Fusion Phosphate carries none, so tell the grower to make up 3 kg of nitrogen for each bag. Fusion Phosphate is not offered on fertigation rows.

Sunflower row and the Green Phosphate rows: the crop plans on van.com.pk. The shopping list on van.com.pk offers Fusion Phosphate in place of Green Phosphate at the same bag count. Rupees = bags × 15,000.

A 40-maund wheat crop takes out an estimated 17.1 kg of P_2O_5 per acre; 1 bag supplies 23 kg.

Removal per tonne is from the International Plant Nutrition Institute (IPNI) tables used on van.com.pk. The grower multiplies these figures by his yield in tonnes per acre (1 maund = 40 kg); the example below uses 40 maunds, which is 1.6 tonnes.

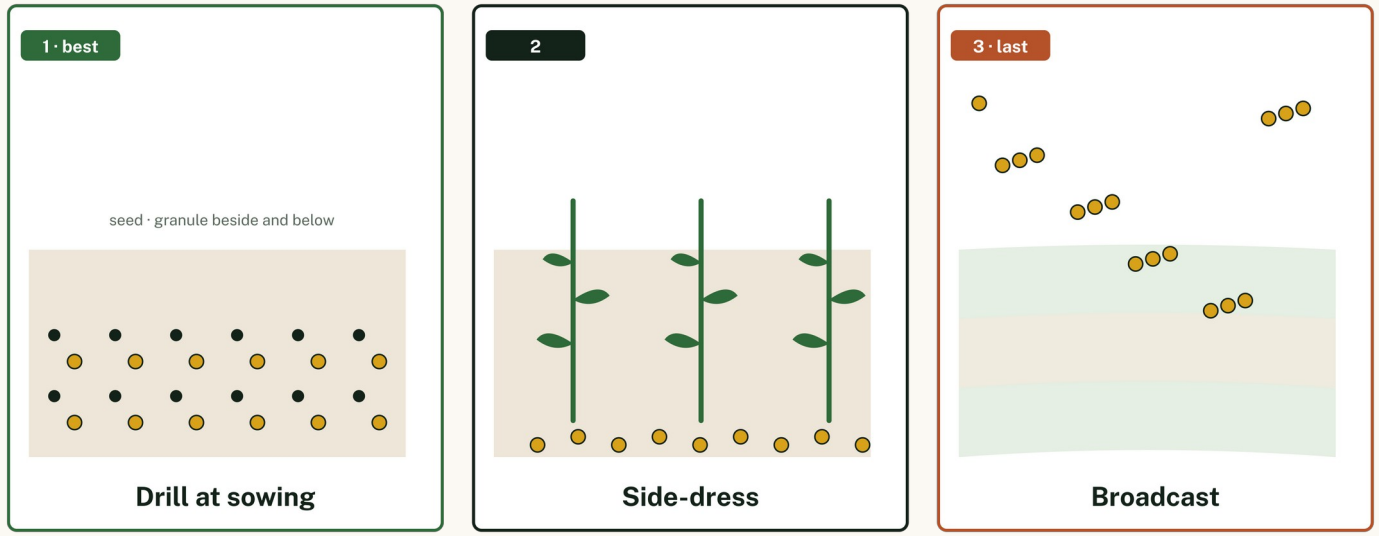

Per tonne harvested	P_2O_5 in the grain or seed	P_2O_5 in the straw or stover	Both together
Wheat, per tonne of grain	8.0 kg	2.7 kg	10.7 kg
Maize, per tonne of grain	6.3 kg	2.9 kg	9.2 kg
Sunflower, per tonne of seed	9.7 kg	2.4 kg	12.1 kg
1 bag of Fusion Phosphate puts in			**23.0 kg**

A wheat crop of 40 maunds per acre (1.6 tonnes) takes out an estimated 12.8 kg of P_2O_5 in the grain and 4.3 kg in the bhusa (straw), 17.1 kg in all. 1 bag supplies 23 kg. 1 bag puts in more P_2O_5 than the 17.1 kg estimated to be taken out; how much of it the root reaches depends on the soil. The crop plan adds V-Phosphate at its own stage.

IPNI nutrient removal tables (metric, January 2015): wheat grain P_2O_5 8.0, straw 2.7 per tonne of grain; maize 6.3 and 2.9; sunflower 9.7 and 2.4. 40 maunds × 40 kg = 1.6 t. No Pakistani removal table exists on the public record, as van.com.pk says.

HOW IT IS APPLIED

Drill it at sowing beside and below the seed, never with the seed, and never put it in a spray or fertigation tank.

1. Drill at sowing, best

The seed drill's fertiliser box places the granule about 5 cm beside and below the seed row, never touching the seed. It is the first thing the root reaches, and the whole bag is in the root zone. Phosphorus does not move through the soil, so drilling matters most for this bag.

2. Side-dress, second

A band beside the row, by hand or planter, at sowing or the first irrigation, covered with soil. The sunflower crop plan does not print side-dressing; it prints: drill at sowing; broadcast if no drill.

3. Broadcast, last

Spread before the last ploughing or before an irrigation, and mixed in. Most of the bag is away from the root. It is a basal granule for the soil: never spray it, and never put it in the fertigation tank.

Drilling is best, side-dressing next, broadcasting last.

VAN gives this order for every basal granule it sells. The crop's response to the same fertiliser depends on where it is placed.

Preference	Method	What it means	Why
1 · best	Drill at sowing	The seed drill's fertiliser box places the granule about 5 cm beside and below the seed row, never touching the seed.	The root reaches a drilled granule sooner than a side-dressed or broadcast one. The granule has the least contact with air, sun and free calcium at the surface, and all of the fertiliser is placed in the root zone.
2 · second best	Side-dress	The granules are placed in a band beside the row, by hand or with a planter, at sowing or at the first irrigation, and covered with soil.	The band is still near the root, but it goes on later and shallower than a drilled granule.
3 · last option	Broadcast	The granules are spread on the surface before the last ploughing or before an irrigation, and mixed in.	Most of the fertiliser lies away from the root, and most of it stays near the surface, in contact with air, sun and free calcium.

In VAN's own fields and partner fields, on wheat, maize and sugarcane, basal fertiliser drilled at sowing has given 7 to 9% more yield per acre than the same bag broadcast: the mean of replicated observations across regions, not a published trial.

OBJECTION 1 OF 8

“15,000 for a bag of TSP? DAP at your counter is cheaper and has nitrogen in it too.”

What the dealer says

Write both prices down; VAN does not publish a DAP price. Then write what is in each bag. This bag holds 23 kg of P_2O_5 and nothing else. A DAP bag also holds 9 kg of nitrogen, but you already get your nitrogen from your nitrogen fertiliser. With this bag you pay only for phosphate, at the highest analysis of any straight phosphate, in a granule that keeps the soil around it acidic for a few weeks. VAN gives no figure for which of the 2 bags puts more phosphate within the root’s reach.

The facts behind the answer

- Fusion Phosphate 50 kg Rs 15,000 (VAN farmer price sheet, Aug 2026). DAP: the counter price, not on the VAN sheet.
- 23 kg P_2O_5 and 0 kg N in this bag (the declared analysis, 46%).
- DAP 18-46-0 carries 23 kg P_2O_5 and 9 kg N per 50 kg (the declared analysis of DAP).

Never say: “TSP beats DAP” or any percentage of phosphate saved. No trial supports it and VAN prints none.

OBJECTION 2 OF 8

“Green Phosphate or Fusion Phosphate? Just tell me which is better.”

What the dealer says

Both go in at land preparation, and the crop plan gives the same number of bags for either. Fusion Phosphate is the straight bag: 23 kg of phosphate, 21.5 kg of it water-soluble, no nitrogen, an acidic granule. Green Phosphate is the coated bag: 16 kg of phosphate and 3 kg of nitrogen, made in an acidic mix and given a humic coating. VAN has no trial that shows one is better than the other. You choose, and I will tell you what is in each.

The facts behind the answer

- Fusion Phosphate is offered in place of Green Phosphate, at the same number of bags (the shopping list on van.com.pk).
- Declared analyses per 50 kg bag: Fusion Phosphate, P_2O_5 46%, 23 kg of P_2O_5; Green Phosphate, 6-32-0, 16 kg of P_2O_5 and 3 kg of N.
- No Fusion Phosphate field trial exists.

Never say: “the coated one is 44% more available”, or “the straight one has 44% more phosphate (23 kg against 16 kg), so it is better”. State what is in each bag; do not call one bag better because it holds more kilograms of P_2O_5.

OBJECTION 3 OF 8

“Can I put it through the drip, or spray it?”

What the dealer says

No. It is a basal granule for the soil. Drill it at sowing beside and below the seed row, side-dress it in a band, or broadcast it and mix it in before sowing. Not all of its phosphate dissolves in water (43% of the bag is water-soluble P_2O_5, out of 46% P_2O_5 in all), and it is not made for a spray or fertigation tank. For a phosphate to put through the water in mid-season, the crop plan names V-Phosphate, at its own stage.

The facts behind the answer

- The product page lists soil application only; the sunflower row reads: drill at sowing; broadcast if no drill (van.com.pk).
- The 3 methods for a basal granule: drill, side-dress, broadcast, in that order.
- The phosphate routes on van.com.pk: Fusion Phosphate is the product for soil application at sowing; V-Phosphate is the product for fertigation.

Never say or give: any foliar or fertigation rate for Fusion Phosphate.

OBJECTION 4 OF 8

“I forgot it at sowing. Can I top-dress it now?”

What the dealer says

Phosphorus does not move to the root; the root has to grow to it. A granule on the surface of a standing crop lies where the roots are not, and in our calcareous soils the calcium binds the phosphate before a root reaches it. For the crop standing now, apply what the crop plan gives at its next stage. Plan this bag for the next crop, drilled at sowing.

The facts behind the answer

- Phosphorus damage in the first weeks cannot be undone later (van.com.pk, the 17-nutrients page).
- Broadcast is the last method because most of the bag is away from the root.
- The sunflower crop plan on van.com.pk puts Fusion Phosphate in at land preparation.

Never say: “Top-dress it and it will catch up.”

OBJECTION 5 OF 8

“Will it burn the seed if I drill it?”

What the dealer says

Drilled correctly, about 5 cm beside and below the seed row, it does not touch the seed. This bag carries no nitrogen, so it releases no ammonia beside the seed. VAN makes no seed-safety claim, so never place it with the seed.

The facts behind the answer

- Placement for every VAN basal granule: beside and below the seed, never touching the seed (the application slide).
- Declared analysis: P_2O_5 46%, no nitrogen.
- Triple super phosphate carries no ammonium, so it releases no ammonia (general chemistry).

Never say: “It is seed safe, put it in the seed row.” VAN prints no seed-safety claim.

OBJECTION 6 OF 8

“How many bags an acre?”

What the dealer says

Use what the crop plan says for your crop. The sunflower crop plan names it: 1.5 bags at land preparation. Where the crop plan names Green Phosphate and you choose Fusion Phosphate instead, the number of bags stays the same: 1 on wheat and rice, 1.5 on maize and cotton, 2 on potato and sugarcane. Make up 3 kg of nitrogen for each bag, because Green Phosphate carries it and this bag does not. More bags than the crop plan gives will not raise the yield, because the soil limits how much phosphate the root can reach.

The facts behind the answer

- Sunflower: 1.5 bags at land preparation (the crop plans on van.com.pk).
- When the grower switches from Green Phosphate to Fusion Phosphate, the number of bags stays the same (the van.com.pk shopping list).
- Green Phosphate rows on van.com.pk: wheat 1, maize 1.5, cotton 1.5, potato 2, sugarcane 2, basmati rice 1.

Never say: “Half a bag will do because it is 46%.”

OBJECTION 7 OF 8

“Is it registered? Whose licence?”

What the dealer says

It is registered under Pakistan Standard PS 216-2009, the standard for triple super phosphate, under manufacturing licence CM/L-2942/2023, with VAN as the maker. Every batch is tested at VAN Lab, PNAC LAB 336, before it ships. Enter the batch number from the bag on van.com.pk, and you can read the certificate for that batch.

The facts behind the answer

- Fusion Phosphate: PS 216-2009 (TSP), CM/L-2942/2023 (the regulatory table on van.com.pk).
- Every batch is released through VAN Lab, PNAC LAB 336 (the corporate profile).
- A grower can read the certificate of analysis for any batch on van.com.pk by its batch number.

Never say or give: a licence expiry date, or “government approved” as a claim about performance.

OBJECTION 8 OF 8

“My soil test says phosphorus is low and I put a bag on every year. Why?”

What the dealer says

Because the field is calcareous. Above pH 8 with free lime, dissolved phosphate reacts with calcium within a few centimetres and comes out of solution, and over the years it changes into forms the root cannot use. A soil test measures the whole field. The acidic zone around each Fusion Phosphate granule is a few centimetres wide and lasts a few weeks: it gives the root time to reach the phosphate, but it does not change the reading on your report. In the Punjab soil survey (about 2016 to 2018), 59.1% of samples were below 7 ppm of available phosphorus, the low level, and 97.9% were below 15 ppm, the adequate level, so your field is not unusual.

The facts behind the answer

- 69.1% of samples tested above pH 8; 59.1% of samples below 7 ppm available phosphorus, the low level; 97.9% below 15 ppm, the adequate level (the Punjab soil survey, 770,160 samples, about 2016 to 2018).
- Above pH 8 with free lime, dissolved phosphate reacts with calcium within centimetres and comes out of solution (Tunesi 1999; Freeman and Rowell 1981).
- The acidic zone is a small patch of soil around each granule; it does not change a soil test (the Green Phosphate page on van.com.pk).

Never say: “It raises your soil phosphorus” or “80% of your phosphate is lost”.

ITS PLACE IN THE CROP PLANS

Fusion Phosphate in the published crop plans, per acre.

Crop	Stage	Rate per acre	Method	Pack
Sunflower	Land Preparation	1.5 bags	Drill at sowing; broadcast if no drill	50 kg

The rows are printed as published in the crop plans on van.com.pk. Coverage: Sunflower is the only published crop plan that names Fusion Phosphate. Its 1 row says drilling at sowing (or broadcasting) and uses the 50 kg bag. Where the 26 crop plans that name Green Phosphate put it into the soil, Fusion Phosphate is the alternative at the same number of bags, with 3 kg of nitrogen made up for each bag; it is not offered on their fertigation rows. Their rows name Green Phosphate. Each rate is per acre, and the crop page scales it to the size of the field.

WHAT VAN DOES NOT CLAIM FOR THIS PRODUCT

A dealer who makes any of these claims is speaking for himself, not for VAN.

1. A yield figure, or that TSP beats DAP or Green Phosphate. No Fusion Phosphate trial exists.
2. That 80% of applied phosphate is fixed, or any percentage fixed or saved. VAN does not print that line.
3. A soil-test change or a field-scale pH change. The acidic zone extends only a few centimetres from each granule and lasts only a few weeks.
4. A foliar or fertigation use or rate. It is a basal granule for the soil.
5. That fewer bags of a more concentrated product mean more crop. A higher concentration saves freight; it does not by itself give more crop.
6. A licence expiry date, or “government approved” as a performance claim. The dealer may quote the licence number.

HOW A GROWER VERIFIES A BAG

Every batch is tested, and the batch number on the bag identifies its certificate.

1 · The batch number

Every bag carries the batch number. Read it to the grower and show him where it is printed.

2 · The certificate of analysis

On van.com.pk, a grower can read the certificate of analysis for any bag by entering the batch number printed on it. The grower does not need to post a sample.

3 · The laboratory

VAN Lab is accredited by the Pakistan National Accreditation Council (PNAC) to ISO/IEC 17025:2017, the international standard for testing laboratories, as LAB 336. Every batch is released through the laboratory before it ships. The certificate carries the laboratory's number.

What a certificate for Fusion Phosphate shows

The certificate gives the tested values for the batch against the declared analysis: total P_2O_5 against 46%, with the water-soluble share where the standard requires it. It also shows the batch number, and the Pakistan Standard PS 216-2009 and licence CM/L-2942/2023 printed on the bag. This training shows no batch result; a grower can read the certificate of his own batch on van.com.pk by its batch number.

THE URDU LINES · REVIEWED 27 SEPTEMBER 2026

The lines a dealer says in Urdu.

The first line is the product's main message. Where its nutrient has one, the line gives VAN's promise word: the 1-word brand message VAN uses for that nutrient. The other 3 lines are key sentences of this deck. Each English line gives the meaning of the Urdu beside it. Send any correction to partner@van.com.pk.

Promise word REACH: "first the root, then everything". *English meaning · Urdu reviewed 27 Sep 2026*	پہلے جڑ، پھر سب کچھ
Phosphorus does not travel to the root. The root has to reach it. *English meaning · Urdu reviewed 27 Sep 2026*	فاسفورس جڑ تک نہیں چلتا، جڑ کو اس تک پہنچنا پڑتا ہے
Drill it at sowing, beside and below the seed, never with the seed. *English meaning · Urdu reviewed 27 Sep 2026*	بوائی پر ڈرل کریں، بیج کے پاس اور نیچے، بیج کے ساتھ کبھی نہیں
Do not compare kilograms; look at what reaches the crop. *English meaning · Urdu reviewed 27 Sep 2026*	کلو کا موازنہ نہ کریں، وہ دیکھیں جو فصل تک پہنچے

Vital Agri Nutrients (Pvt) Ltd, Lahore, has 1 helpline and 3 addresses. VAN sends no group messages; every grower who writes gets a direct reply.

Fusion Phosphate: drill it beside and below the seed. State what is in each bag; more kilograms of P_2O_5 do not make a bag better.
