DEALER TRAINING · NOVEMBER 2026

V-Compost

A 20 kg bag of pelleted compost made in Lahore from screened plant residue, with 25% organic matter and 5% nitrogen.

VAN wrote this deck for its dealers and field team. A dealer can repeat its words to a grower.

THE 30-SECOND EXPLANATION

What a dealer says to a grower in 30 seconds.

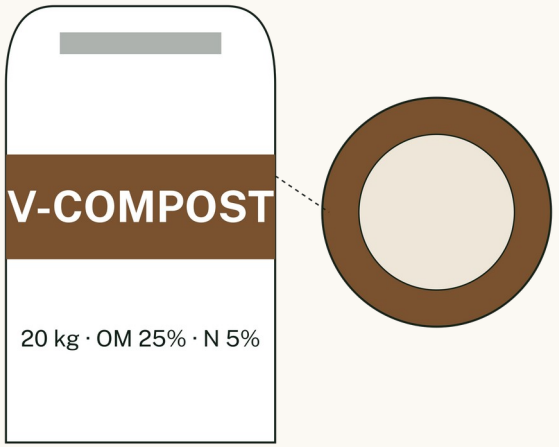

V-Compost is a pelleted compost made only from plant residue, screened for contamination and pathogens before processing, and tested by batch. A 20 kg bag contains 25% organic matter and 5% nitrogen. In the Punjab soil survey (770,160 samples, tested in about 2016 to 2018), mean organic matter was 0.61%, and 97.6% of samples were below 1%. Organic matter helps a soil hold nutrients and water. In a soil with almost none, more of the fertiliser applied washes through. Apply 1 bag an acre, either drilled at sowing or broadcast and worked in at land preparation, so that it sits where the roots will grow. Each bag supplies 1 kg of nitrogen, released slowly; do not cut the nitrogen in the crop plan because of it. It is in the pulse, sugarcane, onion, banana and date palm crop plans. 1 bag will not change a soil test result, and VAN does not say it will.

The 4 points it must cover

1. The bag: organic matter 25%, nitrogen 5%, 20 kg, plant residue only, screened, pelleted. 5 kg of organic matter and 1 kg of nitrogen in every bag.
2. The soil: mean organic matter was 0.61% in 770,160 Punjab samples (about 2016 to 2018); 97.6% were under 1%. The soil has very little organic matter to hold nutrients and water.
3. How it works: organic matter holds nutrients and water, builds soil crumbs, lets air reach the root, feeds soil life and buffers the root zone.
4. The method and the limit: 1 bag an acre at land preparation, drilled at sowing or broadcast and worked in. VAN claims no soil-test change and no yield figure.

Explain the product in simple words a grower uses, and keep to the figures on these slides. Every figure in this 30-second explanation is on the bag, in the published crop plan or in the named evidence on the slides that follow.

What the bag says, and what it is registered as.

20 kg

the bag. 5 kg of organic matter and 1 kg of nitrogen in every bag, from the declared analysis.

OM 25%

organic matter (OM), minimum, as the label and the crop plans give it.

N 5%

nitrogen, minimum. Released as the pellet breaks down: a small background supply that does not replace the nitrogen in the crop plan.

Residue

plant residue is the only feedstock. It is screened for contamination and pathogens before processing, as the circular economy register on van.com.pk states.

0.61%

mean organic matter in 770,160 Punjab soil samples (about 2016 to 2018). 97.6% of them were under 1%.

SFRI

registered with the Soil Fertility Research Institute, SFRI-2025-07. No Pakistan Standard applies, so it has no Pakistan Standards and Quality Control Authority (PSQCA) licence.

Registered as	Registering body	Registration number
V-Compost	Soil Fertility Research Institute	SFRI-2025-07

If a grower asks about registration, give the number in the table. Do not give an expiry date for it.

A GROWER'S QUESTION

“My father’s field held water for days. Mine is hard by the next morning and pale by March, and I put on more bags than he ever did. What went out of it?”

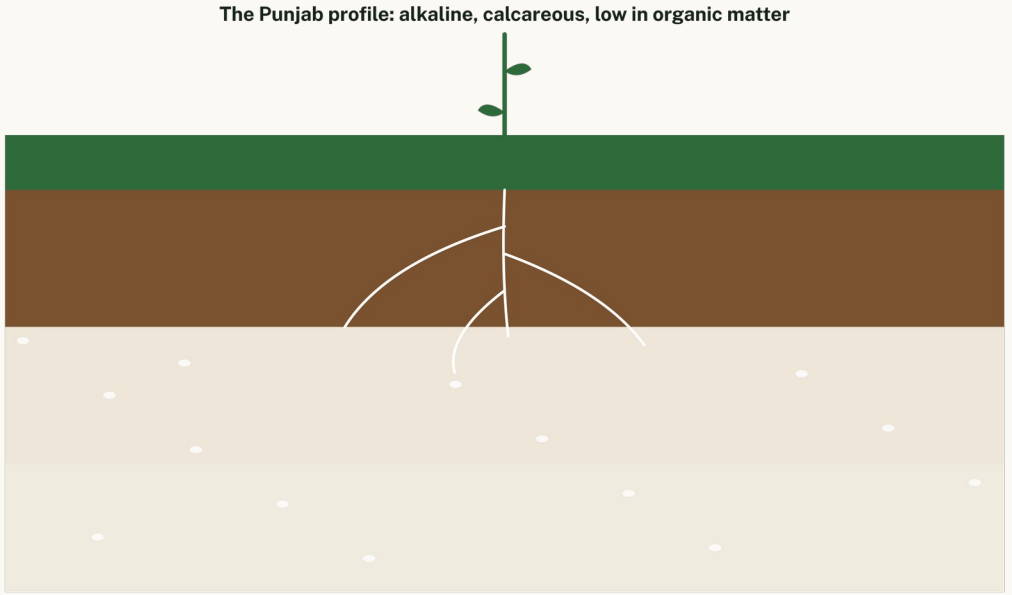

He is describing a soil that has lost its organic matter after decades of cereal cropping with the residue taken off, and he is reading it as a fertiliser problem. The answer has 3 parts: what the Punjab soil survey says, what organic matter does in a soil, and what 1 bag can and cannot do about it.

The next 3 slides give the 3 answers, 1 idea on each slide.

ANSWER 1 OF 3

Punjab’s soil survey shows very little organic matter: a mean of 0.61%.

The Punjab soil survey tested 770,160 soil samples across 36 districts in about 2016 to 2018. Mean organic matter in the samples was 0.61%. 97.6% of samples were below 1% organic matter, and 90.2% were below 0.86%, the level below which Punjab’s soil laboratories rate organic matter as low. The survey did not measure the cause, but over decades of wheat and rice, with the straw sold as bhusa and the stubble burnt, carbon has been taken off these fields every season and not replaced. A soil at that level holds few nutrients and little water, has weak crumb structure and has little soil life. Fertiliser applied to such a soil is held poorly, so more of it washes through.

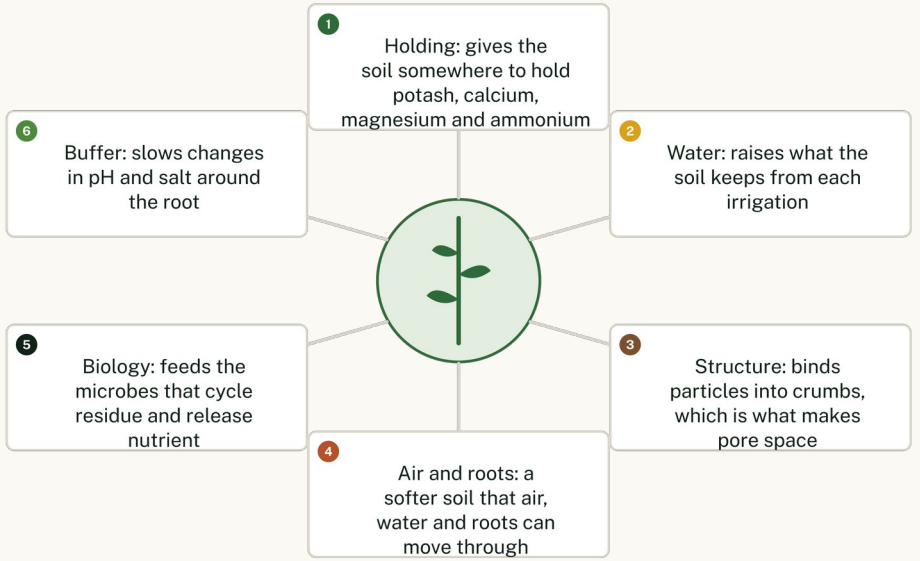

The soil profile is drawn as the survey describes it: alkaline, calcareous, with very little organic matter. The figures are from the Punjab soil survey as van.com.pk publishes them.

Say it like this: “The Punjab soil survey found 0.61% organic matter on average. Most Punjab soil has very little organic matter to hold what you put on it.”

ANSWER 2 OF 3

What organic matter does in the soil: 6 functions.

Organic matter carries the negative charge that holds potash, calcium, magnesium and ammonium where the root can reach them, so they do not wash through. It holds water: a soil with organic matter keeps more of each irrigation for the crop. It binds particles into crumbs, and the crumbs make pore space. Through that pore space, air reaches the root, and water and roots move through a softer soil. It feeds the microbes that cycle residue and release nutrient. It also buffers the soil, so changes in pH and salt affect the root less. NPK fertiliser does none of these things, and it works better on a soil that has organic matter.

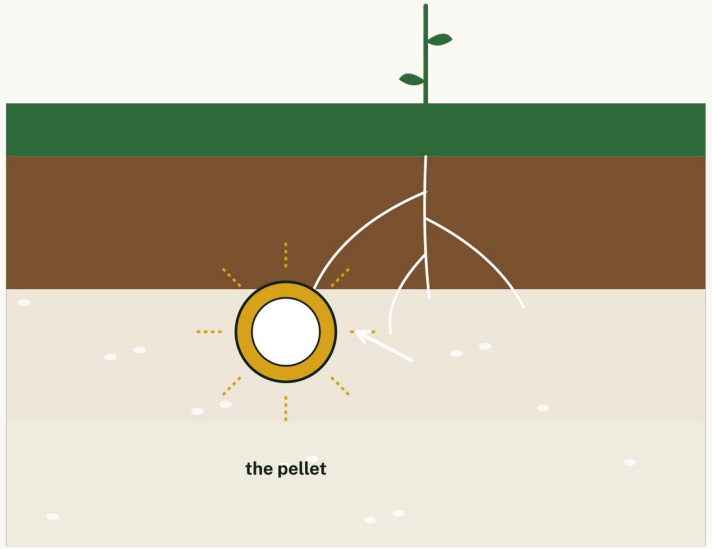

The 6 functions of organic matter, from textbook soil science. The drawing shows the idea; it is not a measurement.

Say it like this: “Fertiliser feeds the crop. Organic matter helps the soil hold that fertiliser until the root takes it up.”

ANSWER 3 OF 3

V-Compost is a measured, screened input, but 1 bag an acre will not change a soil test result.

Farmyard manure varies from load to load, and it carries weed seed and whatever the animals were fed. Where manure has to be bought from a dairy, transporting it costs more than it is worth. V-Compost is plant residue only, screened for contamination and pathogens before processing, then composted, tested by batch, and pelleted so it spreads from the same equipment as a granular fertiliser. 1 bag is 5 kg of organic matter and 1 kg of nitrogen on an acre. Applied at land preparation, each bag places a measured amount of organic matter in the root zone. 5 kg is a small amount for the soil of a whole acre: 1 bag will not change a soil test result, and its nitrogen does not replace the nitrogen in the crop plan.

Plant residue, composted, screened and pressed into a pellet. 25% organic matter, 5% nitrogen. It breaks down in moist soil, and the nitrogen is released slowly as it does.

Say it like this: “It is compost with the same 25% organic matter in every bag, screened, and applied with the drill or the spreader. 1 bag is 5 kg of organic matter. It adds organic matter to the root zone; it will not change your soil test result.”

The pellet in the root zone. The drawing shows no soil-test change, breakdown rate or yield, and VAN claims none.

THE EVIDENCE

What is verified for V-Compost, and what is not.

No trial of V-Compost itself is on VAN's record. A dealer may quote the analysis on the bag, the registration, the soil survey and the making, each only as the right-hand column allows.

Item	What it says	How a dealer may use it
The bag	V-Compost, organic matter 25% minimum, nitrogen 5% minimum, 20 kg, pelleted. Plant residue only, screened.	As fact.
The registration	Registered with the Soil Fertility Research Institute, SFRI-2025-07. No Pakistan Standard applies to the product class, so there is no PSQCA licence, and the site says so.	As fact. Never "PSQCA licensed".
The Punjab soil survey (770,160 samples, about 2016 to 2018)	Mean organic matter 0.61%; 97.6% of samples under 1%; 90.2% below 0.86%, the level Punjab's soil laboratories rate as low.	As fact about the soil. Never as product performance.
The making	Made by VAN from plant residue, screened for contamination and pathogens before processing; every batch tested at VAN Lab, accredited by the Pakistan National Accreditation Council (PNAC) as LAB 336.	As fact. The feedstock and the test, not a purity figure.
Not on file	A V-Compost trial; a yield figure; a soil-test change from any number of bags; a breakdown rate for the nitrogen; a pathogen or heavy-metal limit figure; a second grade.	Not said until VAN names a source.

Sources: the bag and the crop plans on van.com.pk; the regulatory table and the circular economy register on van.com.pk; the Punjab soil survey (770,160 samples, about 2016 to 2018).

The bag and the acre, worked out in kilograms and rupees.

The price is the delivered farmer price from the VAN farmer price sheet, Aug 2026; organic matter and nitrogen are from the declared analysis. Every crop plan row is 1 bag an acre, except date palm at 2 bags.

V-Compost, OM 25% · N 5%	Weight	Organic matter	Nitrogen	Rupees
1 bag of 20 kg	20 kg	5 kg	1 kg	2,300
Sugarcane, pulses, onion, banana: 1 bag an acre	**20 kg**	**5 kg**	**1 kg**	**2,300**
Date palm, newly planted: 2 bags	**40 kg**	**10 kg**	**2 kg**	**4,600**

The grower spends Rs 2,300 an acre to put 5 kg of organic matter and 1 kg of nitrogen into the root zone at land preparation. The crop plan still gives the full nitrogen dose; it does not reduce it because of this 1 kg. VAN has no measured figure for how the soil changes over the following seasons.

Price: the VAN farmer price sheet, Aug 2026. 5 kg = 20 × 0.25; 1 kg = 20 × 0.05. Rates: VAN's published crop plans on van.com.pk, 1 bag on 8 rows, 2 bags on the date-palm row.

What the crop plans put in at land preparation, per acre: field crops.

Bags per acre are from the published crop plans, organic matter from the declared analysis and rupees from the VAN farmer price sheet, Aug 2026.

Crop	V-Compost per acre	Organic matter put in	Rupees per acre	Stage and method, as printed
Sugarcane	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Soybean	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Chickpea	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Lentil	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Mungbean and mash	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)

The crop plans include V-Compost on the pulses for a reason: a legume fixes its own nitrogen, but its root nodules still need a soil with good structure and active soil life. Sugarcane stays in the same ground for years, so land preparation is the only time to put organic matter under it.

Rows as printed in VAN's published crop plans on van.com.pk; 20 kg bag at Rs 2,300. Rupees = bags × 2,300.

What the crop plans put in, per acre: vegetables and orchards.

Bags per acre are from the published crop plans, organic matter from the declared analysis and rupees from the VAN farmer price sheet, Aug 2026.

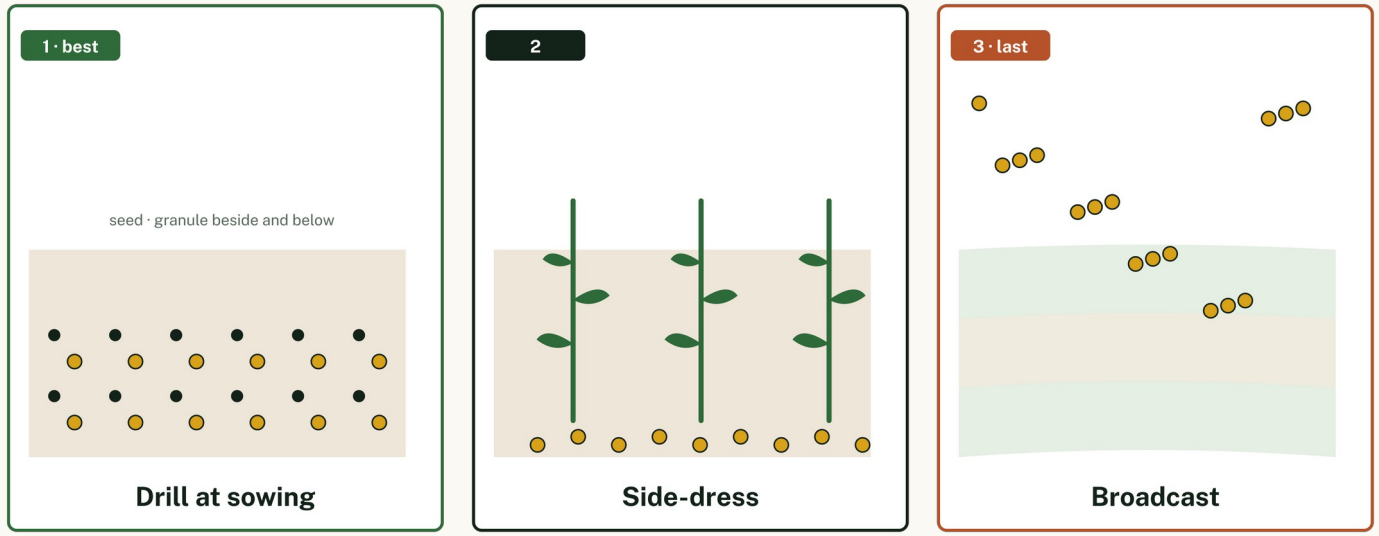

Crop	V-Compost per acre	Organic matter put in	Rupees per acre	Stage and method, as printed
Onion	1 bag of 20 kg	5 kg	2,300	Land preparation / transplanting, broadcasting
Banana, year 1	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Banana, year 2	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Date palm, years 1 to 2	2 bags of 20 kg	10 kg	4,600	Newly planted, side dressing

The orchard crops stay in the same ground for years, so planting is the only time to put organic matter under them. For newly planted date palms, the plan gives 2 bags as a band around the tree. On onion, the plan row says to broadcast it before the seedlings are transplanted.

Rows as printed in VAN's published crop plans on van.com.pk; 20 kg bag at Rs 2,300. Rupees = bags × 2,300.

HOW IT IS APPLIED

Basal, at land preparation: drill it at sowing, or broadcast it and work it in if there is no drill.

1. Drill at sowing, best

The seed drill's fertiliser box places the pellet about 5 cm beside and below the seed row, never touching the seed. Every land-preparation row except onion says: drill at sowing, or broadcast if there is no drill. Sugarcane is one of these rows.

2. Side-dress, second

Place it in a band beside the row or around the young tree, and cover it with soil. For newly planted date palms, the plan gives 2 bags as a side dressing.

3. Broadcast, last

Where there is no drill, spread it before the last ploughing and work it in. On onion, broadcast it before the seedlings are transplanted. Organic matter left on the surface dries and oxidises; worked in, it builds structure where the roots are. Spread it evenly: a strip that is missed gets none.

Drill first, side-dress second, broadcast last.

VAN gives this order for every basal granule it sells, and the compost pellet is one of them. Where the product is placed affects how well the crop can use it.

Preference	Method	What it means	Why
1 · best	Drill at sowing	The seed drill's fertiliser box places the granule about 5 cm beside and below the seed row, never touching the seed.	The root reaches a drilled granule sooner than a side-dressed or broadcast one. The granule has the least contact with air, sun and free calcium at the surface, and all of the fertiliser is placed in the root zone.
2 · second best	Side-dress	The granules are placed in a band beside the row, by hand or with a planter, at sowing or at the first irrigation, and covered with soil.	The band is still near the root, but it goes on later and shallower than a drilled granule.
3 · last option	Broadcast	The granules are spread on the surface before the last ploughing or before an irrigation, and mixed in.	Most of the fertiliser lies away from the root, and most of it stays near the surface, in contact with air, sun and free calcium.

In VAN's own fields and partner fields, on wheat, maize and sugarcane, basal fertiliser drilled at sowing has given 7 to 9% more yield per acre than the same bag broadcast: the mean of replicated observations across regions, not a published trial.

The common practice is to broadcast V-Compost and mix it in at land preparation. A drill with a wide box can place it in the row.

OBJECTION 1 OF 8

“2,300 for 20 kg of compost? A trolley of manure costs less.”

What the dealer says

If you can get good manure cheaply, use it, and VAN will say the same. Most growers cannot get it any more, because dairies sell it. It also brings weed seed and whatever the animals were fed, and much of what you pay to transport is water. This bag is plant residue only, composted and screened for contamination and pathogens, and every bag has the same 25% organic matter, tested before it ships. 1 bag is 5 kg of organic matter and 1 kg of nitrogen, through the drill or the spreader, at land preparation. You are paying for a measured, screened input that is easy to handle.

The facts behind the answer

- 20 kg, Rs 2,300, delivered (the farmer price sheet, Aug 2026).
- 1 bag an acre on 8 crop plan rows; 2 on date palm (the crop plans on van.com.pk).
- 5 kg of organic matter and 1 kg of nitrogen per bag (the declared analysis).
- Plant residue only, screened for contamination and pathogens before processing (the circular economy register on van.com.pk).

Never say: “1 bag equals a trolley of manure” or any tonnage equivalence. No equivalence between the bag and manure is on file.

OBJECTION 2 OF 8

“Will my soil test show more organic matter next season?”

What the dealer says

No, and VAN does not say it will. 1 bag is 5 kg of organic matter on a whole acre of soil, and a soil test samples the soil of the whole acre to plough depth. The bag puts a measured, screened input into the root zone, where the seed and the first roots are. Judge it by how your crop grows over several seasons, and keep testing your soil.

The facts behind the answer

- 5 kg of organic matter per bag; 1 bag an acre on every row but date palm (the declared analysis; the crop plans).
- Mean organic matter 0.61%; 97.6% of samples under 1% (the Punjab soil survey, 770,160 samples, about 2016 to 2018).
- No measurement of a soil-test change exists for the product.

Never say: “It raises your organic matter by X%” or “a bag every season changes the soil test result”.

OBJECTION 3 OF 8

“It has 5% nitrogen. Can I cut a bag of urea?”

What the dealer says

No. 5% of 20 kg is 1 kg of nitrogen, and it is released slowly as the pellet breaks down, a background supply over the season. The crop plan still gives the full nitrogen dose beside it. If you leave out a bag of urea, the crop loses all the nitrogen in that bag, and V-Compost supplies only 1 kg in its place. Buy V-Compost for its organic matter. Its nitrogen is a small background supply.

The facts behind the answer

- 1 kg of nitrogen per bag: 20 kg × 5% (the declared analysis).
- Every crop plan that names V-Compost gives nitrogen in a separate row (the crop plans on van.com.pk).
- Nitrogen in an organic material is released slowly as the material breaks down, on a different timetable from urea (general soil science).

Never say: “It replaces part of your urea” or any nitrogen-saving figure.

OBJECTION 4 OF 8

“Is it organic? Can I sell my crop as organic?”

What the dealer says

The bag is organic matter from plant residue, and that is all VAN says about it. VAN makes no certification claim for V-Compost, and using it does not make a field or a crop “organic” in the certified sense; that is a matter for a certifying body and the whole farm. Say “organic matter”, never “organic certified”.

The facts behind the answer

- The declared analysis is "Organic matter 25% + N 5%" (the bag and the crop plans).
- Registered with the Soil Fertility Research Institute, SFRI-2025-07 (the regulatory table on van.com.pk).
- No organic certification is named on the bag or the site.

Never say: “Certified organic”, “organic farming approved” or any certification mark.

OBJECTION 5 OF 8

“Which crops, and when?”

What the dealer says

The crop plans give 1 bag an acre at land preparation, and 2 bags on date palm. Sugarcane, soybean, chickpea, lentil, mungbean and mash: drill it at sowing, or broadcast it if there is no drill. Onion: broadcast it at land preparation or transplanting. Banana: in year 1 and year 2. Date palm: 2 bags around the newly planted tree. The other crop plans do not include it, and a dealer says so rather than inventing a rate.

The facts behind the answer

- 9 rows in 9 crop plans, every row at land preparation or planting (the crop plans on van.com.pk).
- The product page gives the stage as “Land preparation” and the methods as broadcasting and drilling.
- No rate is published for wheat, maize, rice, cotton or potato.

Never say or give: any rate for wheat, maize, rice, cotton or potato. No crop plan gives one.

OBJECTION 6 OF 8

“Does it carry disease? Compost can.”

What the dealer says

It is plant residue only, screened for contamination and pathogens before processing, and every batch is tested at VAN Lab before it ships. That is what VAN states, and it is on van.com.pk. It contains no animal manure and no municipal waste. VAN has not yet published exact pathogen limits, so it gives no pathogen count. Ask for the batch certificate and see what it reports.

The facts behind the answer

- Plant residue only, screened for contamination and pathogens before processing (the circular economy register on van.com.pk).
- Every batch is tested at VAN Lab, PNAC LAB 336, before it ships.
- van.com.pk gives no heavy-metal or pathogen limit, because VAN has not yet published exact figures.

Never say: “Sterile”, “pathogen-free guaranteed” or a heavy-metal figure. None is published.

OBJECTION 7 OF 8

“Is it registered? It has no PSQCA number on the bag.”

What the dealer says

Correct, and there is a reason. No Pakistan Standard covers the product class, so V-Compost is registered with the Soil Fertility Research Institute instead, under number SFRI-2025-07. It is 1 of the 3 VAN brands without a PSQCA licence, and the regulatory page on van.com.pk says which 3 and why. Every batch is still tested at VAN Lab, PNAC LAB 336, and its certificate can be read on van.com.pk by the batch number.

The facts behind the answer

- V-Compost: Soil Fertility Research Institute, SFRI-2025-07 (the regulatory table on van.com.pk).
- 20 of VAN’s 23 brands hold a live PSQCA licence; the other 3 each have a stated reason. Figures as of July 2026.
- A grower can read the certificate of analysis for any batch on van.com.pk by its batch number.

Never say: “PSQCA licensed” or a PS number for V-Compost.

OBJECTION 8 OF 8

“Should I use this or Humi Grow?”

What the dealer says

They do 2 different jobs, and on a soil under 1% organic matter the crop plan can include both. V-Compost puts organic matter itself into the soil, 5 kg a bag, at land preparation. Humi Grow is concentrated potassium humate: an 8 kg bag holds 3.2 kg of humic acid, which works on the soil’s nutrient-holding sites and around the root. Neither replaces the other, and the crop plan never uses either one in place of a fertiliser nutrient.

The facts behind the answer

- V-Compost: organic matter 25% + N 5%, 20 kg. Humi Grow: potassium humate pellets, humic acid 40%, 8 kg (the labels).
- 5 kg of organic matter in a V-Compost bag; 3.2 kg of humic acid in a Humi Grow bag (the declared analyses).
- V-Compost goes on at land preparation. Humi Grow goes on at land preparation on banana year 1, and later on sugarcane (½ bag in June), onion (germination) and banana year 2 (early growth).

Never say: “The 2 together work better than either alone.” No trial measured that.

V-Compost in the published crop plans, per acre.

Crop	Stage	Rate per acre	Method	Pack
Sugarcane, February planting	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Soybean	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Chickpea	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Lentil	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Mungbean & Mash	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg

The rows are printed as published in the crop plans on van.com.pk. Coverage: these are all 9 rows in the 9 crop plans that name V-Compost. Of these 9 rows, 7 say drilling at sowing (or broadcasting), 1 says broadcasting and 1 says side-dressing. Every row uses the 20 kg bag. Each rate is per acre, and the crop page scales it to the size of the field.

V-Compost in the published crop plans, continued.

Crop	Stage	Rate per acre	Method	Pack
Onion	Land Preparation/Transplanting	1 bag	Broadcasting	20 kg
Banana, 1st year	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Banana, 2nd year	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Date Palm	Year 1–2 · newly planted	2 bags	Side dressing	20 kg

The rows continue from the previous slide. Each rate is per acre, and the crop page scales it to the size of the field.

WHAT VAN DOES NOT CLAIM FOR THIS PRODUCT

A dealer who makes any of these claims is speaking for himself, not for VAN.

1. A yield figure, or that a field “responds” by X. No V-Compost trial exists.
2. A soil organic-matter or soil-test change from 1 bag, or from a bag every season. 5 kg of organic matter on an acre is a root-zone input, and no measurement of a change is on file.
3. “Certified organic”, or that using it makes a crop organic. The bag contains organic matter; organic certification is a separate matter, decided by a certifying body.
4. That it replaces farmyard manure by the trolley, or any tonnage equivalence.
5. That it replaces any part of the nitrogen dose. The crop plan keeps the full urea dose beside the 1 kg of slowly released nitrogen in a bag.
6. A disease-suppression effect, a pathogen count or a heavy-metal figure. VAN states only that it is screened and batch-tested; the limits are not yet published.

HOW A GROWER VERIFIES A BAG

Every batch is tested, and the batch number on the bag identifies its certificate.

1 · The batch number

Every bag carries the batch number. Read it to the grower and show him where it is printed.

2 · The certificate of analysis

On van.com.pk, a grower can read the certificate of analysis for any bag by entering the batch number printed on it. The grower does not need to post a sample.

3 · The laboratory

VAN Lab is accredited by the Pakistan National Accreditation Council (PNAC) to ISO/IEC 17025:2017, the international standard for testing laboratories, as LAB 336. Every batch is released through the laboratory before it ships. The certificate carries the laboratory's number.

What a certificate for V-Compost shows

The certificate gives the declared analysis tested for the batch: organic matter and nitrogen against 25% and 5%. The batch number and the registration SFRI-2025-07 are on the bag. No Pakistan Standard number appears, because none applies. The grower reads the certificate for his own batch on van.com.pk by its batch number.

THE URDU LINES · REVIEW STATUS UNDER EACH LINE

The lines a dealer says in Urdu.

The first line is the product's main message. Where its nutrient has one, the line gives VAN's promise word: the 1-word brand message VAN uses for that nutrient. The other 3 lines are key sentences of this deck. Each English line gives the meaning of the Urdu beside it. Send any correction to partner@van.com.pk.

Organic matter is what lets the soil hold the fertiliser. *English meaning · Urdu reviewed 27 Sep 2026*	نامیاتی مادہ وہ ہے جو زمین کو کھاد روکنے کے قابل بناتا ہے
Plant residue only, screened, pressed into a pellet. 1 bag an acre at land preparation. *English meaning · Urdu reviewed 27 Sep 2026*	صرف پودوں کی باقیات، چھنی ہوئی، دانے کی شکل میں۔ زمین کی تیاری پر فی ایکڑ 1 بوری
Drill it at sowing, or work it into the soil. Left on the surface, it dries and is lost. *English meaning · Urdu reviewed 27 Sep 2026*	بوائی پر ڈرل کریں یا زمین میں ملائیں، سطح پر پڑا رہے تو سوکھ کر ضائع ہو جاتا ہے
Each bag adds 1 kg of nitrogen. Do not reduce the urea because of it. *English meaning · Urdu line pending review*	فی بوری 1 کلو نائٹروجن۔ گنیں ضرور، مگر اس کے بدلے یوریا نہ گھٹائیں

V-Compost: organic matter in a bag, drilled at sowing or worked in at land preparation. It will not change a soil test result.
