DEALER TRAINING · NOVEMBER 2026

Vital Urea

Vital Urea is sulfur coated urea with 32% nitrogen and 13% sulfur, sold in a 25 kg bag. VAN makes it in Lahore under Pakistan Patent 144684.

VAN wrote this deck for its dealers and field team. A dealer can repeat its words to a grower.

THE 30-SECOND EXPLANATION

What a dealer says to a grower in 30 seconds.

Vital Urea is urea coated with sulfur. It contains 32% nitrogen and 13% sulfur and is sold in a 25 kg bag. VAN holds the patent and makes it in Lahore. The granule releases no nitrogen until water reaches it. The coating then breaks down gradually and releases the nitrogen over several days. The crop can take up this nitrogen from the soil during those days. The same granule also supplies sulfur. In the 2023 and 2025 trials, 1 bag of Vital Urea (25 kg) took the place of 1 bag of urea (50 kg) at the first nitrogen application. Some crop plans use Vital Urea at more than 1 stage; follow your crop plan. Drill, side-dress or broadcast it before irrigation or rain. Never put it in the fertigation tank.

The 4 points it must cover

1. The bag: 25 kg, N 32%, S 13%, patent 144684, Pakistan Standard PS 217-2023.
2. How it works: no nitrogen is released until water reaches the granule; then it is released over several days. The granule also supplies sulfur.
3. The use: in the 2023 and 2025 trials, 1 bag of Vital Urea (25 kg) took the place of 1 bag of urea (50 kg) at the first nitrogen application. Some crop plans use it at more than 1 stage; follow the plan.
4. The method: drill, side-dress or broadcast. Never fertigate.

Explain the product in simple words a grower uses, and keep to the figures on these slides. Every figure in this 30-second explanation is on the bag, in the published crop plan or in the named evidence on the slides that follow.

THE BAG

What the bag declares, and how it is registered.

25 kg

bag weight. Each bag carries 8.0 kg of nitrogen and 3.25 kg of sulfur, by the declared analysis.

N 32%

nitrogen by weight, as declared on the front of the bag. The minimum in the standard is 32%.

S 13%

sulfur by weight, as fine elemental sulfur on the outside of the granule. The minimum in the standard is 13%.

144684

the number of the Pakistan patent for this sulfur coated urea, held by VAN.

2014

the year of the coating line at the Lahore plant.

LAB 336

VAN Lab, accredited by the Pakistan National Accreditation Council (PNAC), tests and passes every batch before it ships.

Registered as	Pakistan Standard	Manufacturing licence
Vital Urea	PS 217-2023	CM/L-4126/2025

If a grower asks about registration, give the licence number. Do not give an expiry date for the licence.

A GROWER'S QUESTION

“I put 2 bags of urea on my field, and it turns yellow again 3 weeks later. Where did the nitrogen go?”

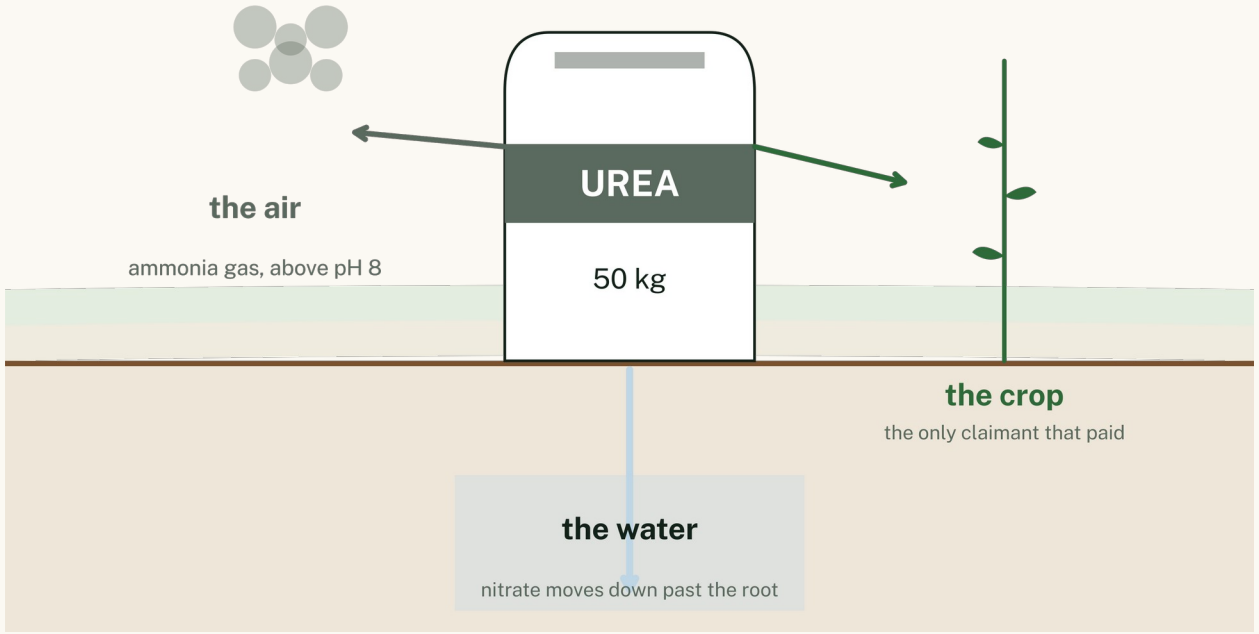

The Vital Urea page of van.com.pk asks this question in the grower’s own words. The answer has 3 parts: where the nitrogen from urea goes, what the coating changes, and what the 3 maize trials measured.

The next 3 slides give the 3 answers, 1 idea on each slide.

ANSWER 1 OF 3

Nitrogen from urea goes to the crop, the air and the water.

Plain urea dissolves at the first irrigation, so all of its nitrogen is open to loss at the same time. In soil above pH 8, part of this nitrogen is lost to the air as ammonia gas (volatilisation). In wet soil, part is lost to the air as other nitrogen gases (denitrification). Another part moves down below the roots with the irrigation water and is lost to water (leaching). The grower paid for all the nitrogen in the bag, including the part that is lost.

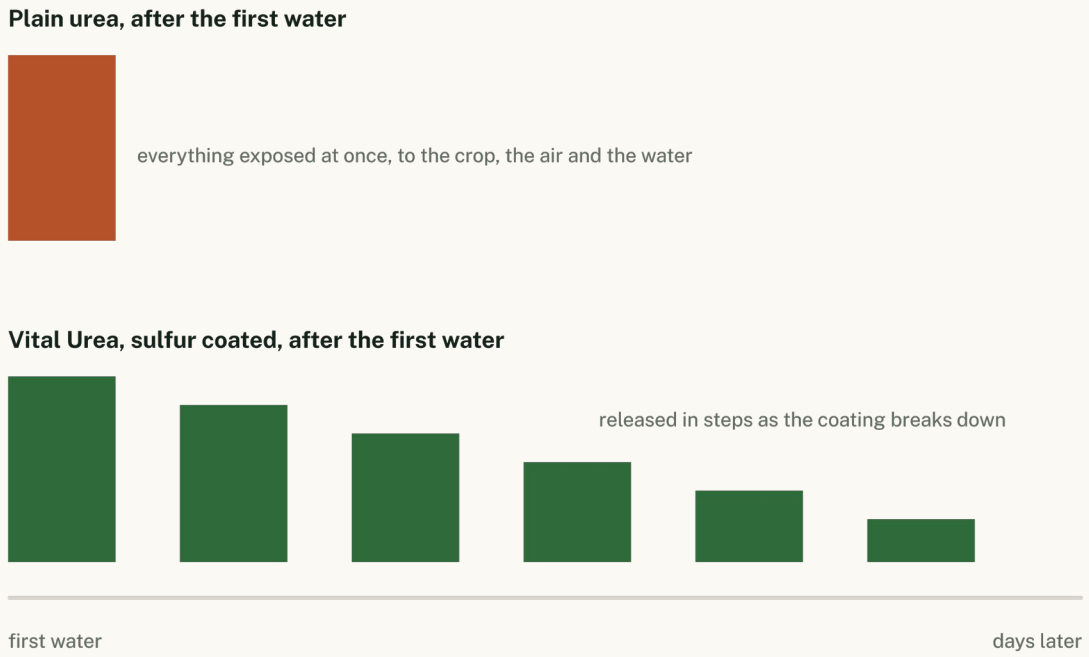

The drawing follows the Vital Urea page of van.com.pk. It does not show what share of the nitrogen is lost to the air or to water, because VAN has no figure measured in Pakistan.

Say it like this: “The nitrogen in your bag went to the crop, the air and the water, and you paid for all of it.”

ANSWER 2 OF 3

The coating releases the nitrogen gradually, so less of it is open to loss at any one time.

Each Vital Urea granule is plain urea inside a coat of fine elemental sulfur, held on by a binder. The granule releases no nitrogen until water reaches it. The coating then breaks down gradually, the urea inside dissolves, and the nitrogen moves into the soil over several days. The crop can take up this nitrogen from the soil during those days. The fine sulfur stays where the granule was placed, and soil bacteria turn it into sulfate there. The crop needs sulfur to turn nitrogen into protein.

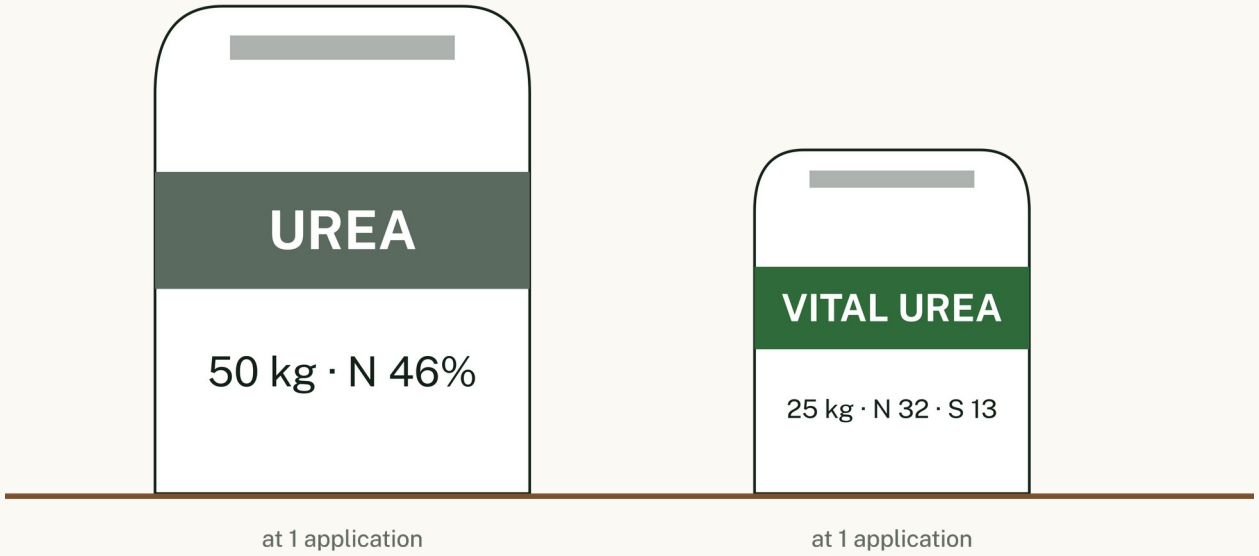

The drawing shows how the coating works. It is not a measurement and has no time scale, because VAN has not measured a release curve in the laboratory.

Say it like this: “The granule gives off no nitrogen until water reaches it. Then the nitrogen comes out gradually, not all at once.”

ANSWER 3 OF 3

In the 2023 and 2025 trials, 1 bag of Vital Urea (25 kg) took the place of 1 bag of urea (50 kg) at the first nitrogen application.

Some crop plans use Vital Urea at more than 1 stage; follow your crop plan. The first application is when the crop needs the least nitrogen. Vital Urea has been used in maize trials run jointly with VAN's research partners Rafhan Maize Products (2023) and Descon Research Farm (2024), and in a partner company's commercial trial in Sheikhupura (2025). When a grower compares the 2 bags, do not call urea better because its bag holds more kilograms of nitrogen.

The drawing compares the 2 bags at that 1 application. VAN gives no yield figure for Vital Urea.

Say it like this: "In the 2023 and 2025 trials, 1 bag of this (25 kg) took the place of 1 bag of urea (50 kg) at the first nitrogen application. Your crop plan may use it at more than 1 stage; follow the plan."

THE EVIDENCE

Vital Urea in 3 maize trials: 2 run jointly with research partners, 1 a partner company's commercial trial.

Vital Urea was used in the 3 maize trials below. More than 500,000 bags of VAN's sulfur coated urea have been sold since 2019, under VAN's brand and partners' brands. VAN gives no yield figure from the trials.

Trial	Year	Run by
Rafhan Maize Products, contract farms	2023	Joint, VAN and Rafhan
Descon Research Farm	2024	Joint, VAN and Descon
A partner company's commercial trial, Sheikhupura	2025	The partner company

Rafhan Maize Products and Descon Research Farm, VAN's research partners, are named with their agreement. Trial summaries are available on request from partner@van.com.pk. Source: the Vital Urea page of van.com.pk.

2 published studies used Vital Urea: 1 on wheat (2024) and 1 on maize (2025).

Each study is cited by its title and journal. VAN gives no yield figure from either study, so a dealer gives none.

Study	Journal	How a dealer may use it
“Impact of Vital Urea (sulfur-coated urea) and plain urea with sulfur on growth and yield of wheat.” Anjum, Umair and others, 2024.	Journal Plantarum 6(2): 79-87	As a study that used Vital Urea. Never quote a yield figure.
“Efficacy evaluation of different doses of nitrogenous fertilizers on the growth and yield of maize (Zea mays).” Umair, Manzoor and others, 2025. It reports the Descon Research Farm trial of spring 2024 (slide 8).	Planta Animalia 4(3): 129-135, DOI 10.71454/PA.004.03.0126	As a study that used Vital Urea. Never quote a yield figure.

Sources: Anjum T., Umair A., Aftab Z., Akram W., Saleem M.S. and Akram S. (2024), Journal Plantarum 6(2): 79-87; Umair A., Manzoor M. and others (2025), Planta Animalia 4(3): 129-135.

How a dealer may use the standard, the certificates and the field observations.

A dealer presents each item as the kind of evidence it is. The Pakistan Standard is a published requirement. The Khaliqabad trial is the 2023 Rafhan trial on slide 8; it was observational, and it was not replicated or randomised. A dealer says nothing beyond this table.

Item	What it says	How a dealer may use it
The Pakistan Standard, PS 217	Sulfur coated urea: nitrogen minimum 32%, sulfur minimum 13%, moisture maximum 1.0%, biuret (a by-product of urea manufacture) maximum 1.5%.	As fact. The product is registered under it.
Batch certificates, VAN Lab, March 2024	3 batches (VU24018 to VU24020): N 32.2%, S 13.24%, biuret 0.57 to 0.70%, moisture 0.83 to 0.86%. Nitrogen by Kjeldahl, sulfur gravimetric.	As the reading on those certificates. The grower reads the certificate of his own batch on van.com.pk by its batch number.
Khaliqabad, maize, 2023	The 2023 maize trial with Rafhan Maize Products (slide 8), on 5 grower sites, from application in August to harvest in December 2023. It was observational: it was not replicated or randomised, and no independent yield measurement was recorded.	As an observational trial, and never as a yield claim.
Other crops	Sugarcane and other crops have grower observations on file and no named trial. On wheat, 1 published study used Vital Urea (slide 9).	Not used as a result. VAN's named trials of Vital Urea are on maize, and VAN gives no yield figure from any trial or study.

Sources: Pakistan Standards and Quality Control Authority (PSQCA) standard for sulfur coated urea, Table III; VAN Lab batch certificates SUC/189 to 191, March 2024; the Vital Urea page of van.com.pk for Khaliqabad. All are verified items or printed on the pack, except Khaliqabad, an observational trial.

At 1 application where Vital Urea replaces urea: what the grower buys and what he pays.

Prices are delivered farmer prices from the VAN farmer price sheet, August 2026. Nitrogen and sulfur are calculated from the declared analysis on each bag.

At that application, 1 acre	Bag weight	Nitrogen	Sulfur	Price (Rs)
Urea, 1 bag of 50 kg (N 46%)	50 kg	23.0 kg	0 kg	4,895
Vital Urea, 1 bag of 25 kg (N 32%, S 13%)	25 kg	8.0 kg	3.25 kg	6,500
The difference	**25 kg less**	**15.0 kg less**	**3.25 kg more**	**1,605 more**

At that 1 application on 1 acre, the bag of Vital Urea carries 15 kg less nitrogen than the bag of urea, adds 3.25 kg of sulfur, and costs Rs 1,605 more. VAN gives no yield figure for Vital Urea, so the table puts no rupee value on the crop's response.

Urea 50 kg Rs 4,895 and Vital Urea 25 kg Rs 6,500: VAN farmer price sheet, August 2026, and the wheat and potato cost plans. 23.0 kg N = 50 × 0.46; 8.0 kg N = 25 × 0.32; 3.25 kg S = 25 × 0.13.

In the crop plans, Vital Urea costs Rs 6,500 to Rs 19,500 an acre, from wheat to sugarcane and citrus.

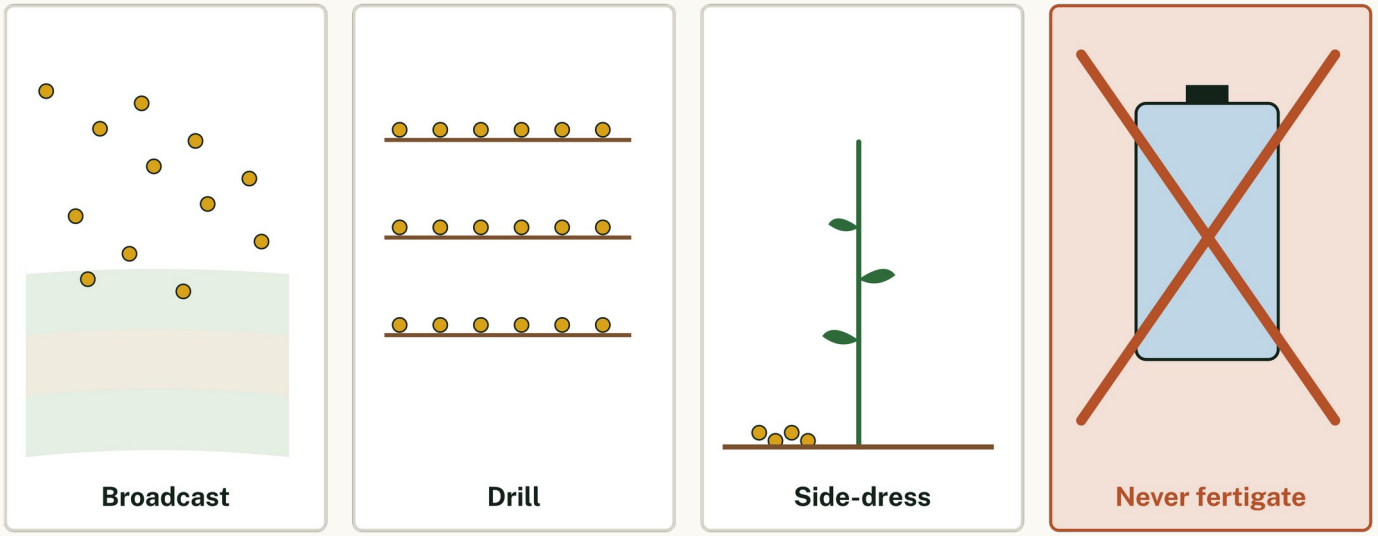

Each line of this table adds up the Vital Urea rows of that crop's published plan, per acre, at Rs 6,500 a bag (VAN farmer price sheet, August 2026). Nitrogen and sulfur are from the declared analysis. VAN gives no yield figure, so the table puts no rupee value on the crop's response.

Crop	Vital Urea in the crop plan, per acre	Bags	Nitrogen	Sulfur	Rs per acre
Wheat	Land preparation: 1 bag	1	8 kg	3.25 kg	6,500
Maize (Corn)	Land preparation: 1 bag. Germination: 1 bag	2	16 kg	6.5 kg	13,000
Basmati Rice	Early growth: 1 bag	1	8 kg	3.25 kg	6,500
Hybrid Rice	Early growth: 1 bag	1	8 kg	3.25 kg	6,500
Cotton	Germination: 1 bag. Grand growth: 1 bag	2	16 kg	6.5 kg	13,000
Sugarcane, February planting	Germination: 1 bag + ½ bag in March; 1 bag + ½ bag in April	3	24 kg	9.75 kg	19,500
Ratoon Sugarcane	Land preparation: 1 bag. Germination: 1 bag	2	16 kg	6.5 kg	13,000
Potato	Land preparation: 1 bag. Germination: 1 bag	2	16 kg	6.5 kg	13,000
Tomato	Land preparation/transplantation: 1 bag	1	8 kg	3.25 kg	6,500
Chili	Land preparation/transplantation: 1 bag. Germination: 1 bag	2	16 kg	6.5 kg	13,000
Onion	Early growth (20 DAT): 2 bags	2	16 kg	6.5 kg	13,000
Citrus, 5 years and over	Land preparation: 2 bags. Germination: 1 bag	3	24 kg	9.75 kg	19,500

Vital Urea 25 kg Rs 6,500: VAN farmer price sheet, August 2026. Per bag: 8.0 kg N = 25 × 0.32; 3.25 kg S = 25 × 0.13; sulfur rounded to 2 decimal places. Bags: the Vital Urea rows of the crop plans on van.com.pk for the 12 crops on the crop plan slides of this deck, added up. Rupees = bags × 6,500.

HOW IT IS APPLIED

Drill, side-dress or broadcast. Never fertigate.

Drill first, at sowing

Drill it beside and below the seed, never touching it. At sowing, it can be mixed with the phosphate fertiliser and drilled with it. Side-dressing is second, and broadcasting is the last option. Apply it at the stage the crop plan names, before irrigation or rain: a dry granule releases nothing.

Why drilling comes first

In VAN's replicated field observations on wheat, maize and sugarcane, a drilled basal fertiliser gave 7 to 9% more yield per acre than a broadcast one. This is an observation, not a published trial.

Never in the fertigation tank

A crushed granule is plain urea. A granule put in the fertigation tank also acts as plain urea: the coating no longer protects it, and its nitrogen is open to loss to the air and to water.

OBJECTION 1 OF 8

“Rs 6,500 for 25 kg, when a 50 kg bag of urea is Rs 4,895?”

What the dealer says

Yes. At an application where it replaces a bag of urea, you buy 25 kg instead of 50 kg, so you carry half the weight, and you pay Rs 1,605 more. You buy 15 kg less nitrogen, plus 3.25 kg of sulfur coated onto the same granule. The coated granule releases its nitrogen over several days, so less of it is open to loss at one time. Follow your crop plan for the number of applications. I will show you the table.

The facts behind the answer

- Urea 50 kg Rs 4,895; Vital Urea 25 kg Rs 6,500 (VAN farmer price sheet, August 2026).
- 23.0 kg N in the urea bag; 8.0 kg N and 3.25 kg S in the Vital Urea bag.
- In the 2023 and 2025 trials, 1 bag of Vital Urea (25 kg) took the place of 1 bag of urea (50 kg) at the first nitrogen application; some crop plans use Vital Urea at more than 1 stage (VAN, 10 November 2026).
- The maize trials: run jointly with research partners Rafhan Maize Products (2023) and Descon Research Farm (2024), and a partner company’s commercial trial in Sheikhupura (2025).

Never say: “It pays for itself by X rupees an acre.” VAN prints no rupee value per acre for extra grain and no cost per kg of nitrogen recovered.

OBJECTION 2 OF 8

“Fewer kilograms means less feed. My crop will go hungry.”

What the dealer says

The nitrogen in a bag of urea goes to the crop, the air and the water. Plain urea dissolves at the first irrigation, so all of its nitrogen is open to loss at the same time. The coated granule releases its nitrogen gradually over several days, and the crop can take it up from the soil during those days. So the kilograms of nitrogen in each bag do not show which bag feeds the crop better.

The facts behind the answer

- Vital Urea page of van.com.pk, answers 1 and 2: nitrogen from urea goes to the crop, the air and the water; the coating releases it gradually, so less is open to loss at any one time.
- A yield figure is among the claims VAN does not make (the Vital Urea page on van.com.pk).

Never say: “Half of urea is wasted” or any loss percentage. VAN has no Pakistani figure for the share lost, so it prints none.

OBJECTION 3 OF 8

“I used it and my soil test did not change.”

What the dealer says

A soil test is not expected to change, and VAN does not claim that it will. The granule has an acidic effect, but only in a zone a few centimetres around it, and only while it is releasing nitrogen. A soil test measures the whole field. Vital Urea affects how much nitrogen the crop can take up while the granule is releasing it. That effect shows in the crop, not in the soil test report.

The facts behind the answer

- The Vital Urea page lists a change in soil pH or in a soil test among the claims VAN does not make.
- The coating releases the nitrogen gradually. It does not change the soil across the field.

Never say: “It improves your soil” or “it fixes soil pH”.

OBJECTION 4 OF 8

“Can I put it through the drip or the flood water?”

What the dealer says

No, never. Vital Urea is drilled, side-dressed or broadcast as whole granules on the soil. A crushed granule is plain urea, and a granule in the tank acts as plain urea too: the coating no longer protects it, and its nitrogen is open to loss to the air and to water. If you give your nitrogen by fertigation, this is not the product for that application.

The facts behind the answer

- Methods on the site and in the crop plans: drilling, side-dressing, placement and broadcasting. No fertigation row exists for Vital Urea.
- VAN’s rule: never fertigate; a crushed granule is plain urea.

Never say: “Dissolve it first” or “it works in the tank if you stir it”.

OBJECTION 5 OF 8

“At which stage do I put it on?”

What the dealer says

Apply it early, before irrigation, at the stage the crop plan names for your crop. Wheat: 1 bag at land preparation. Maize: 1 bag at land preparation and 1 at germination. Cotton: 1 bag at germination and 1 at grand growth. Rice: 1 bag at early growth. The release starts with the first irrigation or rain.

The facts behind the answer

- The Vital Urea rows of the published crop plans, 12 crop plans, on the crop plan slides of this deck.
- The release drawing has no time scale.

Never give a day count for the release, such as “it lasts 45 days”.

OBJECTION 6 OF 8

“How many bags per acre?”

What the dealer says

Use the rate the crop plan gives for your crop. Wheat takes 1 bag; maize, cotton and potato take 1 bag at each of 2 stages; sugarcane takes 2 applications in March (1 bag and ½ bag) and 2 in April (1 bag and ½ bag). More bags than the crop plan gives do not mean more yield; they give the crop more nitrogen than it can take up.

The facts behind the answer

- Rates per acre as published in the crop plans (crop plan slides).

Never say: “Double the bags for double the yield.”

OBJECTION 7 OF 8

“Is it registered? Who says it is what the bag says?”

What the dealer says

It is registered under Pakistan Standard PS 217-2023, with manufacturing licence CM/L-4126/2025, and VAN holds Pakistan Patent 144684 for it. Every batch is tested at VAN Lab, accredited by the Pakistan National Accreditation Council (PNAC) as LAB 336, before it ships. On van.com.pk, enter the batch number from your bag, and you can read the certificate for that batch.

The facts behind the answer

- Regulatory table on van.com.pk: Vital Urea, PS 217-2023, CM/L-4126/2025.
- Older bags print the 2017 edition of the standard, PS 217-2017 (3rd Rev), on the back. Where the standard on the bag differs from the one on the batch certificate, rely on the certificate.
- Standard minimums: N 32%, S 13%.

Never give an expiry date for the licence, or use “government approved” as a claim about performance.

OBJECTION 8 OF 8

“My crop is already yellow. Will this green it up this week?”

What the dealer says

Not this week. Vital Urea releases its nitrogen gradually over several days after the first irrigation, so it will not green a yellow crop in a few days. Apply it at the next stage the crop plan names, before irrigation, and expect a gradual response.

The facts behind the answer

- Vital Urea page, answer 2: the granule releases no nitrogen until water reaches it; then the nitrogen is released over several days.
- Apply early: VAN’s method guidance.

Never say: “It will green up in 3 days.” Do not give a number of days, and do not claim that it will rescue a yellow crop.

Vital Urea in the published crop plans, per acre.

Crop	Stage	Rate per acre	Method	Pack
Wheat	Land Preparation	1 bag	Drill at sowing, or side-dress at the first irrigation; broadcast if neither is possible	25 kg
Maize (Corn)	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	25 kg
Maize (Corn)	Germination	1 bag	Side dressing/Placement	25 kg
Basmati Rice	Early Growth	1 bag	Side dressing/Broadcasting	25 kg
Hybrid Rice	Early Growth	1 bag	Side dressing/Broadcasting	25 kg
Cotton	Germination	1 bag	Placement/Broadcasting	25 kg

The rows are printed as published in the crop plans on van.com.pk. Coverage: these 3 slides show 12 of the 27 crop plans that name Vital Urea, and 18 of its 45 rows. Of these 18 rows, 4 say drilling at sowing (or broadcasting), 4 say broadcasting, 3 say side-dressing or broadcasting and 7 give other methods. Every row uses the 25 kg bag. Each rate is per acre, and the crop page scales it to the size of the field.

Vital Urea in the published crop plans, continued.

Crop	Stage	Rate per acre	Method	Pack
Cotton	Grand Growth	1 bag	Placement/Broadcasting	25 kg
Sugarcane, February planting	Germination	1 bag + ½ bag in March; 1 bag + ½ bag in April (2 applications each month)	Placement/Broadcasting	25 kg
Ratoon Sugarcane	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	25 kg
Ratoon Sugarcane	Germination	1 bag	Placement	25 kg
Potato	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	25 kg
Potato	Germination	1 bag	Side dressing	25 kg

The rows continue from the previous slide. Each rate is per acre, and the crop page scales it to the size of the field.

Vital Urea in the published crop plans, continued.

Crop	Stage	Rate per acre	Method	Pack
Tomato	Land Preparation/Transplantation	1 bag	Broadcasting	25 kg
Chili	Land Preparation/Transplantation	1 bag	Broadcasting	25 kg
Chili	Germination	1 bag	Side dressing	25 kg
Onion	Early Growth (20 DAT)	2 bags	Broadcasting	25 kg
Citrus, 5 years and over	Land Preparation	2 bags	Broadcasting	25 kg
Citrus, 5 years and over	Germination	1 bag	Side dressing/Broadcasting	25 kg

The rows continue from the previous slide. Each rate is per acre, and the crop page scales it to the size of the field.

WHAT VAN DOES NOT CLAIM FOR THIS PRODUCT

A dealer who makes any of these claims is speaking for himself, not for VAN.

1. A yield figure. VAN gives no yield figure from the 3 maize trials or the 2 published studies.
2. A release curve measured in the laboratory. VAN has none, so the drawing has no time scale.
3. That the coating stops nitrogen being lost to the air as ammonia gas. The coating releases the nitrogen gradually, so less of it is open to loss at any one time (slide 6).
4. A change in soil pH or in a soil test. The granule's acidic effect is limited to a zone a few centimetres around it, while it releases nitrogen.
5. A ratio of nitrogen saved per kg of sulfur, such as "12 to 15 kg N per kg S". VAN no longer prints it.
6. That it makes soil phosphorus or zinc available, or that every soil is low in sulfur.

HOW A GROWER VERIFIES A BAG

Every batch is tested, and the batch number on the bag identifies its certificate.

1 · The batch number

Every bag carries the batch number. Read it to the grower and show him where it is printed.

2 · The certificate of analysis

On van.com.pk, a grower can read the certificate of analysis for any bag by entering the batch number printed on it. The grower does not need to post a sample.

3 · The laboratory

VAN Lab is accredited by the Pakistan National Accreditation Council (PNAC) to ISO/IEC 17025:2017, the international standard for testing laboratories, as LAB 336. Every batch is released through the laboratory before it ships. The certificate carries the laboratory's number.

What a certificate for Vital Urea shows

The certificate reports nitrogen (Kjeldahl method) and sulfur (gravimetric method), with biuret and moisture, against the PS 217 limits: N minimum 32%, S minimum 13%, moisture maximum 1.0%, biuret maximum 1.5%. The March 2024 batches on file read N 32.2% and S 13.24%. The bag prints the batch number, the Pakistan Standard and the licence number. Older bags print the 2017 edition of the standard, PS 217-2017 (3rd Rev), on the back. Where the standard on the bag differs from the one on the certificate, rely on the certificate.

THE URDU LINES · REVIEWED 27 SEPTEMBER 2026

The lines a dealer says in Urdu.

The first line is the product's main message. Where its nutrient has one, the line gives VAN's promise word: the 1-word brand message VAN uses for that nutrient. The other 3 lines are key sentences of this deck. Each English line gives the meaning of the Urdu beside it. Send any correction to partner@van.com.pk.

Promise word RELEASE: "nitrogen drop by drop".

قطرہ قطرہ نائٹروجن

English meaning · Urdu reviewed 27 Sep 2026

Nothing happens in the granule until water reaches it.

پانی پہنچنے تک دانے میں کچھ نہیں ہوتا

English meaning · Urdu reviewed 27 Sep 2026

Drill it, side-dress it, or broadcast it. Never put it in the tank.

ڈرل کریں، قطار کے ساتھ دیں، یا چھٹہ دیں۔ ٹینک میں کبھی نہ ڈالیں

English meaning · Urdu reviewed 27 Sep 2026

Do not compare kilograms; look at what reaches the crop.

کلو نہ گنیں، وہ گنیں جو فصل تک پہنچے

English meaning · Urdu reviewed 27 Sep 2026
