Where a plan row says “Drill at sowing; broadcast if no drill”, drill the fertiliser, and broadcast it only if no drill is available.

1. Drill at sowing (preferred)

The seed drill's fertiliser box places the granule about 5 cm beside and below the seed row, never touching the seed.

2. Side dressing (second choice)

The granules are placed in a band beside the row, by hand or with a planter, at sowing or at the first irrigation, and covered with soil.

3. Broadcasting (least preferred)

The granules are spread over the field surface before the last ploughing or before an irrigation, and mixed into the soil.

Rates are per acre. Each rate names the size of its bag or pack, in kg or litres: "½ of a 25 kg bag" is 12.5 kg. Products named in grey are commodity inputs that VAN does not make.

About this plan. This crop plan is a general guide for a typical crop on a typical soil, and it does not replace a soil test. VAN can prepare a plan for your own farm from your soil analysis, your yield target and the other conditions of your field that affect how much fertiliser to apply. Ask for one on WhatsApp at +92 300 5003041 or at kisan@van.com.pk.

Lab report for each batch. VAN tests every batch before it ships. At www.van.com.pk/verify.html, you can type the batch number printed on any VAN bag and open the lab report for that batch.
