

DEALER TRAINING · SEPTEMBER 2026

Crop Force

NPK in 1 granule, 2 grades: 15-15-15 to build the crop, 12-12-18 for the stage that fills it.

For VAN dealers and the field team, written so a dealer can repeat it to a grower. Lahore.

What a dealer says in 30 seconds.

Crop Force is nitrogen, phosphate and potash in 1 bag, at a fixed ratio, registered as PS 933-2026. 2 grades: 15-15-15, equal thirds, for building the crop, in 1 kg and 20 kg; and 12-12-18, weighted to potash, for the stage that sets and fills, in 10 kg. Only 1% of all nutrient applied in Pakistan is potash, and the Crop Force bag prints that line. A grower who buys urea and DAP and skips the potash is growing a tall crop that fills light; this bag puts the third nutrient back in the same pass. It is a soil granule: drill it beside and below the row, side-dress it in a band, or broadcast and work it in. The published programmes name the 15-15-15 grade, side-dressed, on banana, citrus, garlic and watermelon. The 12-12-18 grade is sold on enquiry for the fill stage.

The 4 things it must contain

- 1** The bag: 15-15-15 in 1 kg and 20 kg; 12-12-18 in 10 kg. PS 933-2026, CM/L-4298/2026. 3 kg each of N, P₂O₅ and K₂O in a 20 kg bag.
- 2** The reason: 1% of Pakistan's applied nutrient is potash. A ratio in 1 bag removes the missing third nutrient and the 3-bag rate error.
- 3** The 2 grades: equal thirds to build the crop; potash-weighted for the stage that fills it. The programme rows name 15-15-15.
- 4** The method: a soil granule. Drill beside and below the row first, side-dress second, broadcast last. Work it in.

Say it in the grower's own words. Every figure in these 30 seconds is on the bag, in the published crop programme, or in the named evidence on the slides that follow.

THE BAG

What the bag says, and what it is registered as.

20 kg

the 15-15-15 bag. 3 kg of N, 3 kg of P₂O₅ and 3 kg of K₂O in every bag, from the declared analysis. A 1 kg pack of the same grade exists.

15-15-15

N 15% min, P₂O₅ 15% min, K₂O 15% min: equal thirds, the grade every programme row names.

12-12-18

N 12% min, P₂O₅ 12% min, K₂O 18% min: the potash-weighted grade, in the 10 kg bag. 1.2, 1.2 and 1.8 kg per bag.

1%

of all nutrient applied in Pakistan is potash. The line is printed on the Crop Force bag.

2 datasheets

1 per grade, on van.com.pk. Both grades sit under 1 standard and 1 licence.

Crop Star

the former name. Same product, renamed Crop Force in July 2026.

Registered as	Pakistan Standard	Manufacturing licence
Crop Force	PS 933-2026	CM/L-4298/2026

No expiry date is printed in this deck. The licence number is what a dealer quotes.

A GROWER'S QUESTION

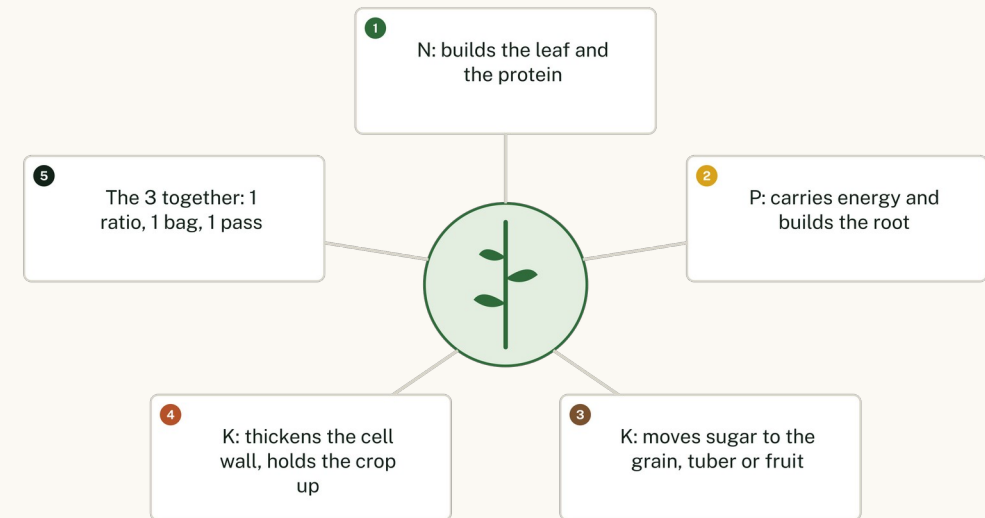

“Urea, DAP and potash: 3 bags, 3 rates, and I never know if I got the ratio right. Is there a bag that already has all 3?”

The grower is describing Pakistani practice: heavy nitrogen, heavy phosphate, almost no potash, and 3 rates guessed at the field edge. The answer is 3 ideas: why the ratio matters more than any 1 bag, why there are 2 grades and not 1, and why a soil granule is judged by where it lands.

The 3 answers on the next 3 slides, 1 idea each.

3 nutrients, 1 ratio, 1 bag. The crop grows to its shortest nutrient.

Nitrogen builds the leaf. Phosphate carries energy and builds the root. Potash moves the sugar the leaf makes into the grain, tuber or fruit, and thickens the cell wall so the crop stands. A crop grows to the limit of the nutrient it has least of; another bag of urea does nothing for a field that is short of potash. Only 1% of all nutrient applied in Pakistan is potash, about 1 kg for every 83 kg of nitrogen. Crop Force puts the 3 in 1 bag at a fixed ratio, so the third nutrient goes on in the same pass and the ratio is not guessed.

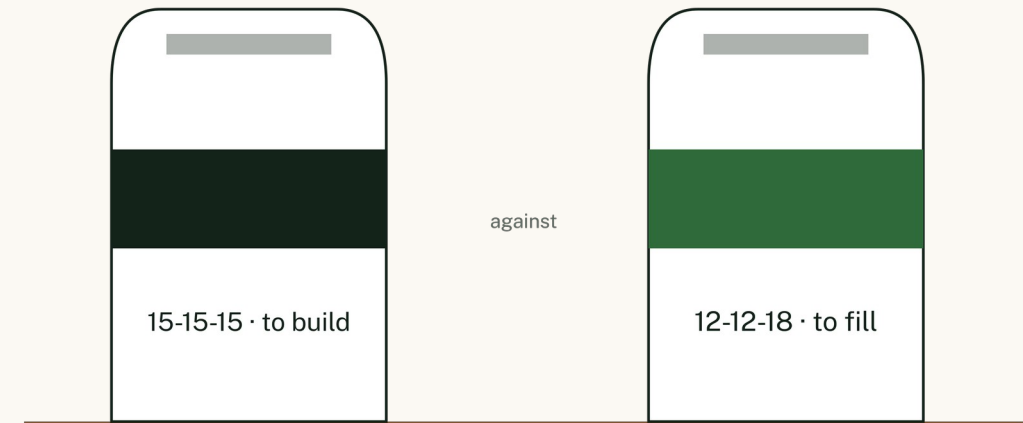

The jobs of N, P and K, as VAN's 17-nutrients page gives them. A picture of the idea, not a measurement.

Say it like this: “You have been making the tallest stave taller. This bag brings the short ones up with it.”

2 grades, 2 jobs: equal thirds to build, potash-weighted to fill.

15-15-15 carries the 3 in equal measure. It is the grade for building the plant and the grade the published programmes name. 12-12-18 carries half again as much potash as nitrogen or phosphate. It is for the stage when the crop has stopped building leaf and started setting and filling: tuber, boll, fruit. The grade is chosen by the stage, not by the crop. As general agronomy, cereals take most of their potash before flowering; potato, banana, tomato and orchard fruit keep taking it through fill. That is why there are 2 grades and not 1.

Say it like this: “15-15-15 while the crop is building. 12-12-18 when it starts to fill. 1 grade all season is the wrong grade for half of it.”

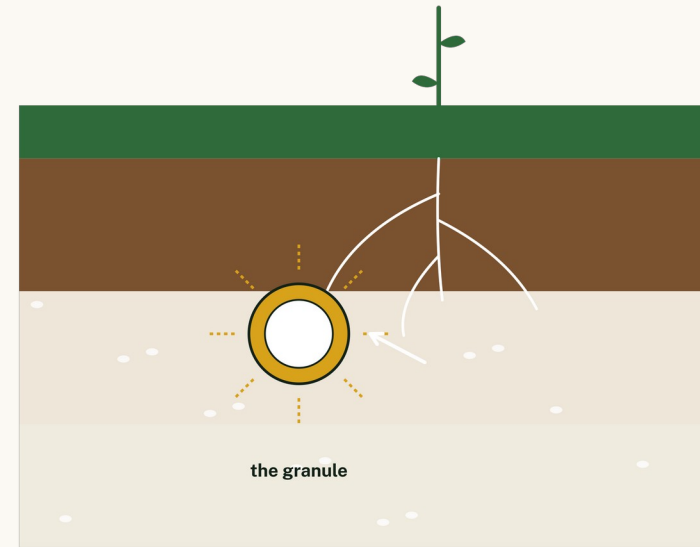

The 2 bags are drawn as the 2 grades. No uptake curve is drawn, because no Pakistani measurement of one is on VAN's record.

A soil granule is judged by where it lands.

Crop Force is a granule for the soil. The phosphate in it meets calcium within centimetres on ground above pH 8, and the potash moves little once it is in the soil, so the granule has to be where the root will grow. Drilled beside and below the row, the root meets it first and the whole bag is in the root zone. Side-dressed in a band and covered, it is still near the root. Broadcast on the surface, most of the bag is away from the root until it is worked in. Material left on the surface is feeding the surface.

Say it like this: “Put it where the root will be. Beside the row, below the seed, covered. Not on top.”

Nitrogen, phosphate and potash in the same bag, at the declared ratio. Placed in a band beside the row, below the surface, where the root grows.

The granule beside the row with the root reaching it. The method order is the next 2 slides.

THE EVIDENCE

What is verified for Crop Force, and what is not.

No trial of Crop Force is on VAN's record. What a dealer may state as fact is the bag, the licence, the national potash figure, the soil record and the 2 datasheets, each as what it is.

Item	What it says	How a dealer may use it
The bag	Crop Force, NPK 15-15-15 (N, P ₂ O ₅ , K ₂ O 15% min each) in 1 kg and 20 kg; 12-12-18 (12, 12, 18% min) in 10 kg. Formerly Crop Star, renamed July 2026.	As fact. Read the grade off the front of the bag in hand.
The licence	Pakistan Standard PS 933-2026 for multnutrient fertilizer; manufacturing licence CM/L-4298/2026. 1 licence covers both grades.	As fact. The number, never an expiry date.
The datasheets	2 technical datasheets on van.com.pk, 1 per grade.	Hand the grower the datasheet for his grade.
National potash use	Only 1% of all nutrient applied in Pakistan is potash: printed on the Crop Force bag. About 1 kg of potash for every 83 kg of nitrogen: VAN's national figure.	As fact.
The soil record (Punjab, 770,160 samples)	87.8% of samples below the working threshold for available potash; 59.1% low in phosphorus; 69.1% above pH 8.	As fact about the soil. Never as product performance.
Not on file	A Crop Force trial or yield figure; a granule-uniformity or segregation figure for this product; a Pakistani uptake curve; a compound-versus-blend measurement.	Not said until named.

Sources: the bag; the Pakistan Standard and licence register; the crop programmes on van.com.pk; the VAN farmer price sheet, Aug 2026; the Punjab soil record (770,160 samples); the 2 Crop Force datasheets on van.com.pk.

The 3 packs, in the grower’s own back-of-envelope.

Prices from the VAN farmer price sheet, Aug 2026, delivered farmer price. Nutrients from the declared analysis. The 10 kg bag is the 12-12-18 grade; the 1 kg and 20 kg are 15-15-15.

Pack	Weight	N	P ₂ O ₅	K ₂ O	Rupees
Crop Force 15-15-15, bag	20 kg	3.0 kg	3.0 kg	3.0 kg	9,000
Crop Force 15-15-15, pack	1 kg	150 g	150 g	150 g	750
Crop Force 12-12-18, bag	10 kg	1.2 kg	1.2 kg	1.8 kg	4,900

A 20 kg bag puts 3 kg of each nutrient in the ground for 9,000 rupees. The 10 kg bag of 12-12-18 puts on 1.8 kg of K₂O against 1.2 of the other 2, for 4,900. That is the counter arithmetic. Do not turn it into cost per kilogram of nutrient; the 3 are bought together for the ratio.

Crop Force 1 kg PKR 750, 10 kg PKR 4,900, 20 kg PKR 9,000: the VAN farmer price sheet, Aug 2026. 3.0 kg = 20 × 0.15; 150 g = 1 × 0.15; 1.2 kg = 10 × 0.12; 1.8 kg = 10 × 0.18. Grade per pack as VAN registers it.

What the 4 programme rows put in, per acre.

Every Crop Force programme row names the 15-15-15 grade. Rate and pack as printed; nutrients from the declared analysis; rupees at the VAN farmer price sheet, Aug 2026.

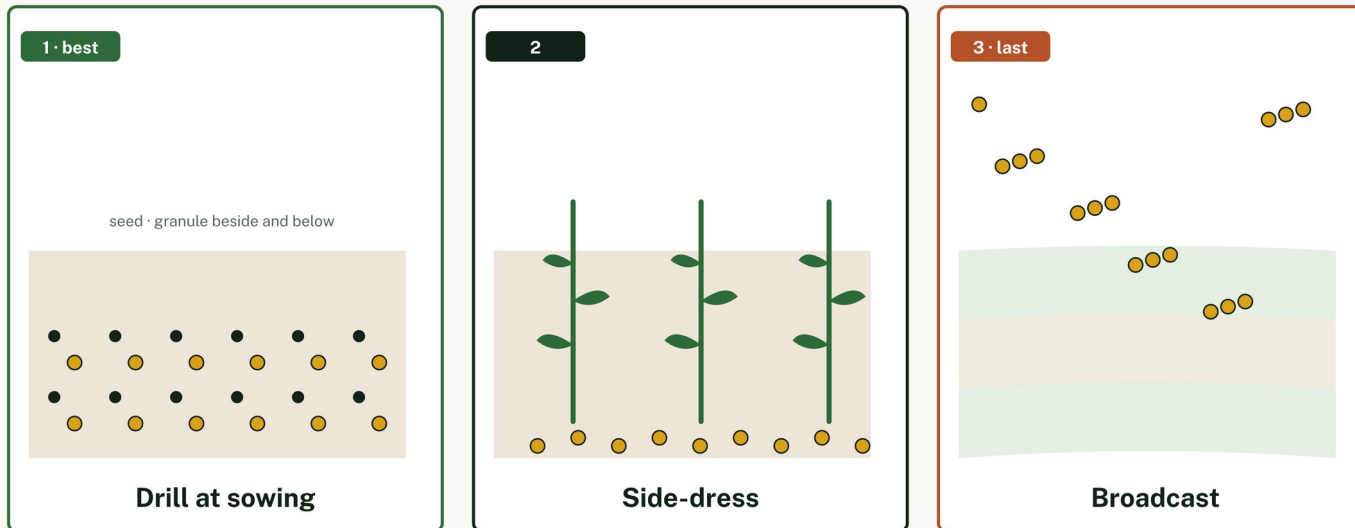

Crop	Crop Force per acre	N	P ₂ O ₅	K ₂ O	Stage, method and rupees
Banana, year 1	1 bag of 20 kg	3.0 kg	3.0 kg	3.0 kg	Maturity, side dressing/placement, 9,000
Garlic	¼ bag of 20 kg (5 kg)	750 g	750 g	750 g	Maturity, side dressing/placement, 2,250
Citrus	1 pack of 1 kg	150 g	150 g	150 g	Grand growth, side dressing/placement, 750
Watermelon	3 packs of 1 kg	450 g	450 g	450 g	Maturity, side dressing/placement, 2,250

On banana the grower puts 3 kg of each nutrient in a band at maturity for 9,000 rupees an acre. The garlic row is a quarter of the same bag, 5 kg. The citrus and watermelon rows are in the 1 kg pack. The 12-12-18 grade is in no programme row; it is sold on enquiry.

Rows from the crop programmes on van.com.pk (banana year 1, garlic, citrus, watermelon), as printed. Garlic ¼ bag = 5 kg of the 20 kg bag; 2,250 = 9,000 ÷ 4. Watermelon 3 × 750 = 2,250.

HOW IT GOES ON

A soil granule. Drill first, side-dress second, broadcast last. Work it in.

1. Drill, best

At sowing, the seed drill's fertilizer box places the granule about 5 cm beside and below the seed row, never touching the seed. The root meets it first and the whole bag is in the root zone. VAN names drilling and band placement for Crop Force.

2. Side-dress, second

A band beside the row, by hand or planter, covered with soil. Every Crop Force programme row prints "Side dressing/Placement": banana, garlic and watermelon at maturity, citrus at grand growth. A band for a standing crop is still a band near the root.

3. Broadcast, last

Spread before the last ploughing or before an irrigation and mixed in at once. Material left on the surface is not where the root is. An even spread matters: a missed strip is a missed acre, and it shows at harvest.

Drill first, side-dress second, broadcast last.

The order for every basal granule VAN sells. The same bag gives a different result by where it lands.

Order	Method	What it means	Why
1 · best	Drill at sowing	The seed drill's fertilizer box places the granule about 5 cm beside and below the seed row, never touching the seed.	The root meets it first. Least contact with air, sun and free calcium at the surface. The whole bag is in the root zone.
2	Side-dress	A band beside the row, by hand or planter, at sowing or the first irrigation, covered with soil.	Still a band near the root, but later and shallower than a drill.
3 · last	Broadcast	Spread on the surface before the last ploughing or before an irrigation, and mixed in.	Most of the bag is away from the root, and most of it is exposed at the surface.

In VAN's own fields and partner fields, on wheat, maize and sugarcane, basal fertilizer drilled at sowing has given 7 to 9% better response than the same bag broadcast: the mean of replicated observations across regions, not a published trial.

The programme rows place it or side-dress it at grand growth and maturity. At sowing, drill it.

“9,000 for 20 kg? Urea and DAP are cheaper per bag.”

The dealer says, out loud

They are different bags doing different jobs. A bag of urea is nitrogen; a bag of DAP is nitrogen and phosphate; neither has potash, and only 1% of what Pakistan applies is potash. This bag is 3 kg of nitrogen, 3 kg of phosphate and 3 kg of potash together, at a ratio you do not have to guess. Write the 3 bags you buy now on your paper and the potash line will be empty. That empty line is what you are paying for here.

The fact behind it

- Crop Force 20 kg 9,000 rupees; 1 kg 750; 10 kg of 12-12-18 4,900 (VAN farmer price sheet, Aug 2026).
- 3 kg N, 3 kg P₂O₅ and 3 kg K₂O in a 20 kg bag, from the declared analysis (the bag).
- Only 1% of all nutrient applied in Pakistan is potash (printed on the Crop Force bag).

Never say: “It gives you X more maunds” or a rupees-per-acre return. No yield figure exists for the product. No cost per kg of nutrient against another bag.

“Which grade do I buy?”

The dealer says, out loud

By the stage, not the crop. 15-15-15 while the crop is building leaf, root and stem; it is the grade the published programmes name. 12-12-18 when the crop starts to set and fill: tuber, boll, fruit. Potato, banana, tomato and orchard fruit keep taking potash through fill, so they are where the potash-weighted grade earns its place. A grower running 1 grade all season is running the wrong one for half of it.

The fact behind it

- Every Crop Force programme row names 15-15-15 (the crop programmes on van.com.pk).
- 15-15-15 is sold in 1 kg and 20 kg; 12-12-18 in 10 kg, on enquiry, in no programme row.
- Cereals take most of their potash before flowering; potato, banana, tomato and orchard fruit keep taking it through fill (general agronomy).

Never say: Calling 12-12-18 “balanced”. It is potash-weighted. And never a crop list for 12-12-18 as if it were a published programme.

“Is it a blend? Will the 3 separate in the bag or the spreader?”

The dealer says, out loud

What I can tell you is what is on the bag: 3 nutrients at the declared ratio, registered under PS 933-2026, every batch tested at VAN Lab before it ships. Spread it evenly and work it in; an even spread is the grower's part of the ratio. Whether each granule carries all 3 is a question I will get answered from VAN in writing rather than guess at the counter.

The fact behind it

- NPK 15-15-15 and 12-12-18, PS 933-2026, CM/L-4298/2026 (the bag and the licence register).
- Every batch is tested at VAN Lab, PNAC LAB 336, before it ships.
- VAN has published no compound-versus-blend statement or segregation figure for Crop Force.

Never say: “Every granule has all 3” or “blends are bad”, until VAN confirms which it is. No segregation percentage.

“Can I put it through the drip or the flood water?”

The dealer says, out loud

Crop Force is a soil granule: drilled, side-dressed or banded, and worked in. That is what every programme row says. If the 1 kg pack you have is a soluble powder grade, the pack and the datasheet will say so; do not dissolve a granular bag and expect it to clear the filter. For a fertigation NPK at this stage, ask VAN which product the plan names.

The fact behind it

- VAN names drilling, side dressing and band placement for Crop Force; no programme row says fertigation or foliar.
- Every Crop Force row prints side dressing/placement (the crop programmes on van.com.pk).
- The 2 datasheets on van.com.pk say which form each grade is sold in.

Never say: A fertigation or foliar rate for Crop Force. None is published.

“Which stage, and how much?”

The dealer says, out loud

What the programme says for your crop. Banana in year 1: 1 bag of 20 kg at maturity, side-dressed. Garlic: a quarter bag, 5 kg, at maturity. Citrus: 1 kg at grand growth. Watermelon: 3 kg at maturity. All in a band beside the row, covered. For a crop with no Crop Force row, the plan on van.com.pk names the products it does use, and the dealer follows the plan.

The fact behind it

- Banana year 1: 1 bag of 20 kg at maturity; citrus: 1 pack of 1 kg at grand growth (the crop programmes on van.com.pk).
- Garlic: ¼ bag of 20 kg, 5 kg, at maturity; watermelon: 3 packs of 1 kg at maturity (the crop programmes on van.com.pk).
- All 4 rows: side dressing/placement.

Never say: “1 bag an acre on every crop.” A general bag-per-acre rate is not a programme rate.

“Is it registered? What is the licence?”

The dealer says, out loud

Pakistan Standard PS 933-2026 for multinutrient fertilizer, manufacturing licence CM/L-4298/2026, VAN as the registered maker. 1 licence covers both grades, and each grade has its own datasheet on van.com.pk. Every batch is tested at VAN Lab, PNAC LAB 336, before it ships. Read the batch number off the bag and VAN sends you that batch's certificate, free.

The fact behind it

- Crop Force: PS 933-2026, CM/L-4298/2026 (the licence register on van.com.pk).
- 2 datasheets on van.com.pk, 1 per grade.
- Formerly Crop Star, renamed Crop Force in July 2026.

Never say: An expiry date, or “government approved” as a claim about performance.

“I used it and my soil test did not change.”

The dealer says, out loud

It will not, and VAN does not say it will. A bag puts 3 kg of each nutrient into the band where the root is; a soil test measures the field. If your potash reads low, that is a season-after-season basal job and the soil's reserve doing most of the work: 87.8% of Punjab samples read low. Crop Force changes what the root meets in the band. Judge it in the crop, not on the soil report.

The fact behind it

- 87.8% of Punjab samples read below the working threshold for available potash; 59.1% low in phosphorus (the Punjab soil record, 770,160 samples).
- A 20 kg bag puts 3 kg of each nutrient into the band, not across the field.
- VAN claims no soil-test change for any of its granules.

Never say: “It improves your soil” or “it raises your soil potash reading”.

WHERE IT SITS IN THE CROP PROGRAMME

Crop Force in the published programmes, per acre.

Crop	Stage	Rate per acre	Method	Pack
Banana, 1st year	Maturity	1 bag	Side dressing/Placement	20 kg
Citrus, 5 years and over	Grand Growth	1 pack	Side dressing/Placement	1 kg
Garlic	Maturity	¼ bag	Side dressing/Placement	20 kg
Watermelon	Maturity	3 pack	Side dressing/Placement	1 kg

WHAT VAN WILL NOT CLAIM FOR IT

A dealer who says any of these is speaking for himself, not for VAN.

1

A yield figure, or that a balanced grade gives X% more than urea and DAP alone. No Crop Force trial exists.

2

That 12-12-18 is “balanced”. It is potash-weighted, and that is the point of it.

3

That every granule carries all 3 nutrients, or a segregation percentage against blends, until VAN confirms compound or blend in writing.

4

An uptake curve or a percentage of potash taken up by a stage. No Pakistani measurement of one exists.

5

A fertigation or foliar rate. Crop Force is a soil granule; no such rate is published.

6

A soil-test change, or that 1 bag is a crop’s whole programme. The plan on van.com.pk is the programme.

Every batch is tested. The bag carries the proof.

1 · The batch number

It is printed on the bag. Read it to the grower and show him where it is. Every bag of every batch carries one.

2 · The certificate of analysis

For any batch, free on request. Send the batch number off the bag to kisan@van.com.pk or the helpline, and the certificate for that batch comes back. No sample to post.

3 · The laboratory

VAN Lab, PNAC LAB 336, accredited to ISO/IEC 17025:2017. Every batch is released through it before it ships. The certificate carries the laboratory's number.

What a certificate for Crop Force shows

The declared analysis tested for the batch: nitrogen, P_2O_5 and K_2O against 15-15-15 or 12-12-18, with the batch number, the Pakistan Standard PS 933-2026 and licence CM/L-4298/2026 on the bag. Each grade has its own datasheet on van.com.pk. No certificate for a Crop Force batch was on file for this deck, so no batch reading is printed here; the grower asks for his own batch's certificate.

The lines a dealer says in Urdu.

The first line is the promise word from the VAN brand master. The other 3 are the deck's key sentences, translated in a first pass and not yet reviewed by VAN. Say them, and send corrections to partner@van.com.pk.

3 nutrients in 1 bag. No promise word: Crop Force carries all 3.

Urdu first pass, unreviewed

ناٹروجن، فاسفورس اور پوٹاش، ایک ہی تھیلے میں

Only 1% of the nutrient Pakistan applies is potash.

Urdu first pass, unreviewed

پاکستان میں ڈالی جانے والی کھاد کا صرف 1 فیصد پوٹاش ہے

Drill it beside and below the row. Not on top.

Urdu first pass, unreviewed

قطار کے پاس، نیچے ڈرل کریں، اوپر نہ چھوڑیں

15-15-15 while the crop builds; 12-12-18 when it fills.
