

DEALER TRAINING · SEPTEMBER 2026

V-Compost

Organic matter 25% and nitrogen 5% from screened plant residue, pelleted, 20 kg, made in Lahore.

For VAN dealers and the field team, written so a dealer can repeat it to a grower. Lahore.

What a dealer says in 30 seconds.

V-Compost is organic matter in a bag: 25% organic matter and 5% nitrogen, made from plant residue only, screened free of contamination and pathogens, and pressed into a pellet, 20 kg. Punjab's soil record puts mean organic matter at 0.61%, and 97.6% of 770,160 samples sit under 1%. Organic matter is what gives a soil somewhere to hold nutrient and water; a soil with almost none lets the bag move through it. V-Compost puts a measured, tested, consistent input back at land preparation, 1 bag an acre, drilled at sowing or broadcast and worked in, where the root will grow. The nitrogen is 1 kg a bag and comes out slowly; count it, and do not budget the nitrogen line against it. It is on the pulse, sugarcane, onion, banana and date palm programmes. 1 bag will not move the soil test, and VAN does not say it will.

The 4 things it must contain

- 1** The bag: organic matter 25%, nitrogen 5%, 20 kg, plant residue only, screened, pelleted. 5 kg of organic matter and 1 kg of nitrogen in every bag.
- 2** The soil: mean organic matter 0.61% across 770,160 Punjab samples; 97.6% under 1%. Almost no carbon left to hold a cation or a drop of water.
- 3** The mechanism: organic matter holds nutrient and water, builds crumb structure, feeds the biology and buffers the root zone. A soil benefit, in the root zone, at land preparation.
- 4** The method and the limit: 1 bag an acre at land preparation, drilled at sowing or broadcast and worked in. No soil-test change from 1 bag; no yield figure.

Say it in the grower's own words. Every figure in these 30 seconds is on the bag, in the published crop programme, or in the named evidence on the slides that follow.

THE BAG

What the bag says, and what it is registered as.

20 kg

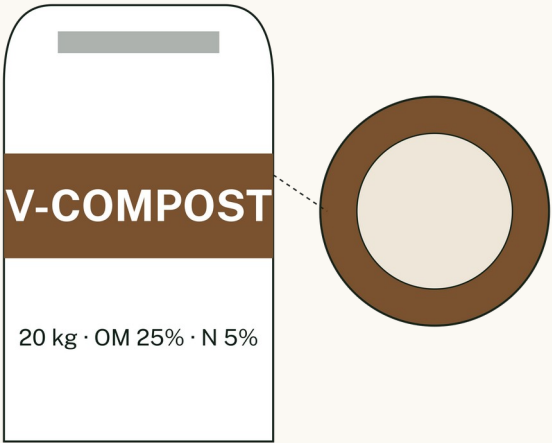

the bag. 5 kg of organic matter and 1 kg of nitrogen in every bag, from the declared analysis.

OM 25%

organic matter, minimum, as the label and the crop programmes print it.

N 5%

nitrogen, minimum. Released as the pellet breaks down, a background supply and never the nitrogen line.

Plant residue

the only feedstock. Screened free of contamination and pathogens before it goes in, as van.com.pk’s soil register states.

0.61%

mean organic matter across 770,160 Punjab soil samples. 97.6% of them read under 1%.

SFRI

registered with the Soil Fertility Research Institute, SFRI-2025-07. No Pakistan Standard applies; it is 1 of the 3 VAN brands without a PSQCA licence, and the site says why.

Registered as	Pakistan Standard	Manufacturing licence
V-Compost	Soil Fertility Research Institute	SFRI-2025-07

No expiry date is printed in this deck. The licence number is what a dealer quotes.

A GROWER'S QUESTION

“My father’s field held water for days. Mine is hard by the next morning and pale by March, and I put on more bags than he ever did. What went out of it?”

He is describing a soil that has lost its organic matter after decades of cereal cropping with the residue taken off, and he is reading it as a fertilizer problem. The answer is 3 ideas: what the soil record says, what organic matter does in a soil, and what 1 bag can and cannot do about it.

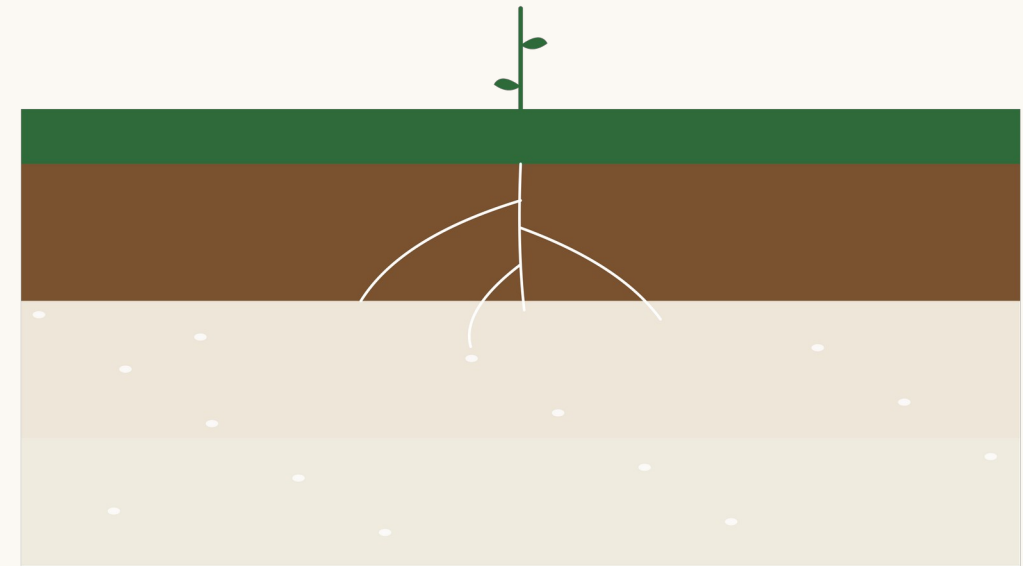

The 3 answers on the next 3 slides, 1 idea each.

The soil record: almost no carbon left.

Punjab tested 770,160 soil samples across 36 districts. Mean organic matter is 0.61%. 97.6% of the samples read under 1%, and 90.2% sit below the province's own working threshold of 0.86%. Decades of wheat and rice, with the straw sold as bhusa and the stubble burnt, take carbon off the field every season and put none back. A soil at that level has little exchange capacity, little water holding, weak crumb structure and not much biology. Every bag that follows is applied to a soil that cannot hold it.

Say it like this: "The report says 0.61% organic matter. Your soil has almost nothing left to hold what you put on it."

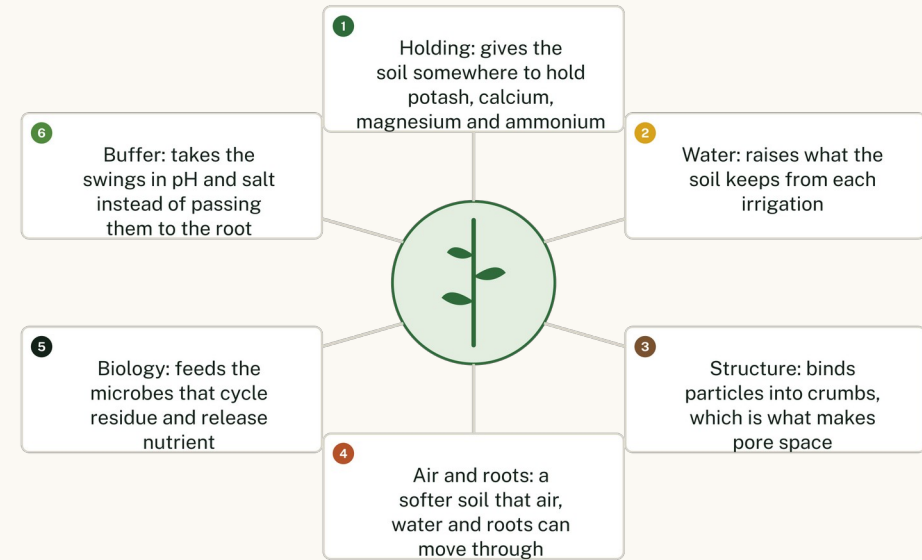

The Punjab profile: alkaline, calcareous, low in organic matter

The soil profile is drawn as the record describes it: alkaline, calcareous, almost without carbon. Figures from the Punjab survey as van.com.pk publishes them.

Organic matter is the floor the nutrients stand on.

Organic matter carries the negative charge that holds potash, calcium, magnesium and ammonium where the root can reach them, so they do not wash through. It holds water: a soil with organic matter keeps more of each irrigation for the crop. It glues particles into crumbs, and the crumbs make the pore space that air, water and roots move through. It feeds the microbes that cycle residue and release nutrient. And it buffers: the soil takes the swings in pH and salt instead of passing them straight to the root. No bag of NPK does any of these 6 jobs. Every bag of NPK works better on a soil that has them.

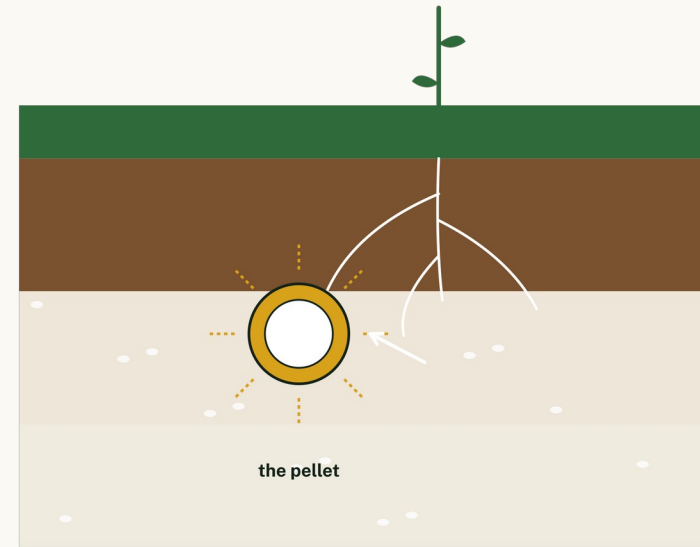

The 6 jobs of organic matter, textbook soil science. A picture of the idea, not a measurement.

Say it like this: “Fertilizer feeds the crop. Organic matter is what lets the soil hold the fertilizer until the crop eats it.”

A measured, screened input, in a bag you can carry. What it can and cannot do.

Farmyard manure varies from load to load, carries weed seed and whatever the animals were given, and costs more to move than it is worth once the dairy sells it. V-Compost is plant residue only, composted, screened free of contamination and pathogens, tested by batch, and pelleted so it spreads from the same equipment as a granular fertilizer. 1 bag is 5 kg of organic matter and 1 kg of nitrogen on an acre. That is a measured input at the root zone at land preparation, season after season. It is a small number against a whole acre of soil, and VAN says so: 1 bag will not move a soil test, and the nitrogen is a background supply, never the nitrogen line.

Say it like this: “It is compost you can plan with: the same 25% every bag, screened, and it goes on with the drill or the spreader. 1 bag is 5 kg of organic matter. It helps the root zone; it does not rewrite your soil test.”

Plant residue, composted, screened and pressed into a pellet. 25% organic matter, 5% nitrogen. It breaks down in moist soil, and the nitrogen comes out slowly as it does.

The pellet in the root zone. No soil-test change, no breakdown rate and no yield is drawn or said.

THE EVIDENCE

What is verified for V-Compost, and what is not.

No trial of V-Compost itself is on VAN's record. What a dealer may state as fact is the bag, the registration, the soil record and the published research below, each as what it is.

Item	What it says	How a dealer may use it
The bag	V-Compost, organic matter 25% minimum, nitrogen 5% minimum, 20 kg, pelleted. Plant residue only, screened.	As fact.
The registration	Registered with the Soil Fertility Research Institute, SFRI-2025-07. No Pakistan Standard applies to the product class, so there is no PSQCA licence, and the site says so.	As fact. Never "PSQCA licensed".
The soil record (Punjab, 770,160 samples)	Mean organic matter 0.61%; 97.6% of samples under 1%; 90.2% below the 0.86% working threshold.	As fact about the soil. Never as product performance.
Published research, not VAN trials	Pakistani calcareous-soil phosphate trials (Ahmad et al. 2022; Mussarat et al. 2021; Mehdi et al. 2003): no phosphate source beat another consistently; the consistent gain came from compost or farmyard manure applied with the phosphate.	Spoken, as research on organic matter with phosphate. Never as a V-Compost result.
The making	Made in VAN's own stream from plant residue, screened free of contamination and pathogens; every batch tested at VAN Lab, PNAC LAB 336.	As fact. The feedstock and the test, not a purity figure.
Not on file	A V-Compost trial; a yield figure; a soil-test change from any number of bags; a breakdown rate for the nitrogen; a pathogen or heavy-metal limit figure; a second grade.	Not said until named.

Sources: the bag and the crop programmes on van.com.pk; the regulatory table and the soil register on van.com.pk; the Punjab soil record (770,160 samples); Ahmad et al. 2022, Mussarat et al. 2021, Mehdi et al. 2003.

The bag, and the acre, in the grower’s own back-of-envelope.

Price from the VAN farmer price sheet, Aug 2026, delivered farmer price. Organic matter and nitrogen from the declared analysis. Every programme row is 1 bag an acre, except date palm at 2.

V-Compost, OM 25% · N 5%	Weight	Organic matter	Nitrogen	Rupees
1 bag of 20 kg	20 kg	5 kg	1 kg	2,300
Sugarcane, pulses, onion, banana: 1 bag an acre	20 kg	5 kg	1 kg	2,300
Date palm, newly planted: 2 bags	40 kg	10 kg	2 kg	4,600

The grower spends 2,300 rupees an acre to put 5 kg of organic matter and 1 kg of nitrogen into the root zone at land preparation. The 1 kg of nitrogen is counted on the programme and never budgeted against the nitrogen line. That is the counter arithmetic. What the soil does with it over seasons is not a number VAN prints.

Price: the VAN farmer price sheet, Aug 2026. 5 kg = 20 × 0.25; 1 kg = 20 × 0.05. Rates: VAN’s published crop programmes on van.com.pk, 1 bag on 8 rows, 2 bags on the date-palm row.

What the programme puts in at land preparation, per acre: field crops.

Bags per acre from the published crop programmes; organic matter from the declared analysis; rupees at the VAN farmer price sheet, Aug 2026.

Crop	V-Compost per acre	Organic matter put in	Rupees per acre	Stage and method, as printed
Sugarcane	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Soybean	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Chickpea	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Lentil	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Mungbean and mash	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)

The pulses are a pattern on purpose: a legume fixes its own nitrogen, and it still needs a soil with structure and biology for the root nodules to work in. Sugarcane stands in the same ground for years, so the land-preparation window is the one chance to put organic matter under it.

Rows as printed in VAN's published crop programmes on van.com.pk; 20 kg bag at PKR 2,300. Rupees = bags × 2,300.

What the programme puts in, per acre: vegetables and orchards.

Bags per acre from the published crop programmes; organic matter from the declared analysis; rupees at the VAN farmer price sheet, Aug 2026.

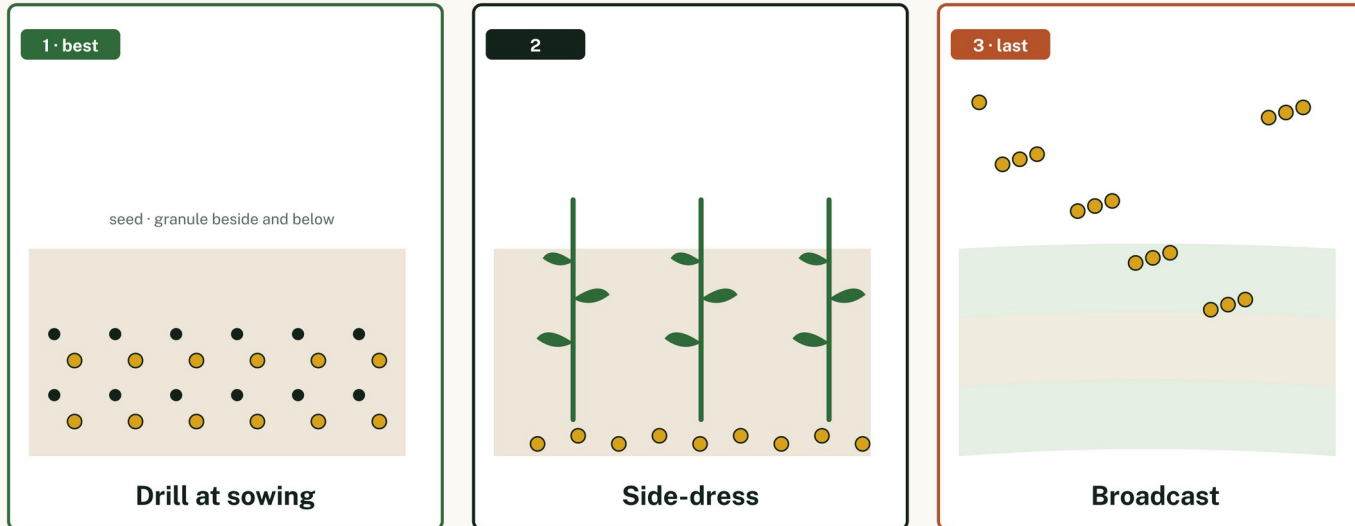

Crop	V-Compost per acre	Organic matter put in	Rupees per acre	Stage and method, as printed
Onion	1 bag of 20 kg	5 kg	2,300	Land preparation / transplanting, broadcasting
Banana, year 1	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Banana, year 2	1 bag of 20 kg	5 kg	2,300	Land preparation, drill at sowing (or broadcast)
Date palm, years 1 to 2	2 bags of 20 kg	10 kg	4,600	Newly planted, side dressing

The orchard crops stand in the same ground for years, so the planting window is the one chance to put organic matter under them; the date palm takes 2 bags as a band around the newly planted tree. On the transplanted onion, the row prints broadcasting before the seedlings go in.

Rows as printed in VAN's published crop programmes on van.com.pk; 20 kg bag at PKR 2,300. Rupees = bags × 2,300.

HOW IT GOES ON

Basal. In the ground at land preparation: drill at sowing, or broadcast and work in if there is no drill.

1. Drill at sowing, best

The seed drill's fertilizer box places the pellet about 5 cm beside and below the seed row, never touching the seed. Every land-preparation row now prints drill at sowing, broadcast if there is no drill. On sugarcane the sett furrow is the band.

2. Side-dress, second

A band beside the row or around the young tree, covered with soil. The date-palm row prints side dressing for the newly planted years, 2 bags.

3. Broadcast, last

Spread before the last ploughing and worked in, where there is no drill, and before the seedlings go in on onion. Organic matter left on the surface dries and oxidises; worked in, it builds structure where the roots are. A missed strip is a missed acre.

Drill first, side-dress second, broadcast last.

The order for every basal granule VAN sells, and a compost pellet is one of them. The same bag gives a different result by where it lands.

Order	Method	What it means	Why
1 · best	Drill at sowing	The seed drill's fertilizer box places the granule about 5 cm beside and below the seed row, never touching the seed.	The root meets it first. Least contact with air, sun and free calcium at the surface. The whole bag is in the root zone.
2	Side-dress	A band beside the row, by hand or planter, at sowing or the first irrigation, covered with soil.	Still a band near the root, but later and shallower than a drill.
3 · last	Broadcast	Spread on the surface before the last ploughing or before an irrigation, and mixed in.	Most of the bag is away from the root, and most of it is exposed at the surface.

In VAN's own fields and partner fields, on wheat, maize and sugarcane, basal fertilizer drilled at sowing has given 7 to 9% better response than the same bag broadcast: the mean of replicated observations across regions, not a published trial.

Broadcast and mixed in at land preparation is the common practice; a drill with a wide box places it in the row.

“2,300 for 20 kg of compost? A trolley of manure costs less.”

The dealer says, out loud

If you can get good manure cheaply, use it, and VAN will say the same. Most growers cannot any more: the dairy sells it, it comes with weed seed and whatever the animals were given, and the water weight is what you pay to cart. This bag is plant residue only, composted, screened for contamination and pathogens, and the same 25% every bag, tested before it ships. 1 bag is 5 kg of organic matter and 1 kg of nitrogen, through the drill or the spreader, at land preparation. You are buying a measured input you can plan with, in a bag you can carry.

The fact behind it

- 20 kg, 2,300 rupees, delivered (the farmer price sheet, Aug 2026).
- 1 bag an acre on 8 programme rows; 2 on date palm (the crop programmes on van.com.pk).
- 5 kg of organic matter and 1 kg of nitrogen per bag (the declared analysis).
- Plant residue only, screened free of contamination and pathogens (the soil register on van.com.pk).

Never say: “1 bag equals a trolley of manure” or any tonnage equivalence. 5 kg of organic matter is 5 kg; no equivalence is on file.

“Will my soil test show more organic matter next season?”

The dealer says, out loud

No, and VAN does not say it will. 1 bag is 5 kg of organic matter on a whole acre of soil, and a soil test measures the whole acre to plough depth. What the bag does is put a measured, screened input into the root zone, where the seed and the first roots are, season after season. Judge it in the root zone and the crop, over seasons, and keep testing the soil for its own sake.

The fact behind it

- 5 kg of organic matter per bag; 1 bag an acre on every row but date palm (the declared analysis; the crop programmes).
- Mean organic matter 0.61%; 97.6% of samples under 1% (the Punjab soil record, 770,160 samples).
- No measurement of a soil-test change exists for the product.

Never say: “It raises your organic matter by X%” or “a programme moves the soil test”.

“It has 5% nitrogen. Can I cut a bag of urea?”

The dealer says, out loud

No. 5% of 20 kg is 1 kg of nitrogen, and it comes out slowly as the pellet breaks down, a background supply over the season. The programme counts it and still prints the full nitrogen line beside it. Cut the urea and the crop is short by the whole bag you cut, less 1 kg. Buy V-Compost for the organic matter; take the nitrogen as a small bonus.

The fact behind it

- 1 kg of nitrogen per bag: $20 \text{ kg} \times 5\%$ (the declared analysis).
- The nitrogen line on every V-Compost programme is a separate row (the crop programmes on van.com.pk).
- Nitrogen in an organic material is released as it breaks down, a different curve from urea (general soil science).

Never say: “It replaces part of your urea” or any nitrogen-saving figure.

“Is it organic? Can I sell my crop as organic?”

The dealer says, out loud

The bag is organic matter from plant residue, and that is all VAN says about it. VAN makes no certification claim for V-Compost, and using it does not make a field or a crop “organic” in the certified sense; that is a matter for a certifying body and the whole farm. Say “organic matter”, never “organic certified”.

The fact behind it

- The declared analysis is "Organic matter 25% + N 5%" (the bag and the crop programmes).
- Registered with the Soil Fertility Research Institute, SFRI-2025-07 (the regulatory table on van.com.pk).
- No organic certification is named on the bag or the site.

Never say: “Certified organic”, “organic farming approved” or any certification mark.

“Which crops, and when?”

The dealer says, out loud

Land preparation, before the crop, on the programmes that print it: sugarcane, soybean, chickpea, lentil, mungbean and mash, drilled at sowing or broadcast if there is no drill; onion at land preparation or transplanting, broadcast; banana in year 1 and year 2; date palm, 2 bags around the newly planted tree. 1 bag an acre. On the other programmes it is not printed, and a dealer says so rather than inventing a rate.

The fact behind it

- 9 rows across 9 programmes, every one at land preparation or planting (the crop programmes on van.com.pk).
- The stage on the product page is soil preparation; the methods are broadcast and drilling.
- No rate is published for wheat, maize, rice, cotton or potato.

Never say: A rate for wheat, maize, rice, cotton or potato from this deck.

“Does it carry disease? Compost can.”

The dealer says, out loud

It is plant residue only, composted and screened free of contamination and pathogens before it goes into the pellet, and every batch is tested at VAN Lab before it ships. That is what VAN states, and it is on the site. No animal manure, no municipal waste. VAN prints no pathogen count, because the exact limits are not yet printed; ask for the batch certificate and read what it carries.

The fact behind it

- Plant residue only, screened free of contamination and pathogens before it goes in (the soil register on van.com.pk).
- Every batch is tested at VAN Lab, PNAC LAB 336, before it ships.
- The site prints no heavy-metal or pathogen limit until it can print them exactly.

Never say: “Sterile”, “pathogen-free guaranteed” or a heavy-metal figure. None is printed.

“Is it registered? It has no PSQCA number on the bag.”

The dealer says, out loud

Correct, and there is a reason. No Pakistan Standard covers the product class, so V-Compost is registered with the Soil Fertility Research Institute instead, SFRI-2025-07. It is 1 of the 3 VAN brands without a PSQCA licence, and the site’s regulatory page says which 3 and why. Every batch is still tested at VAN Lab, PNAC LAB 336, and the certificate is free on request.

The fact behind it

- V-Compost: Soil Fertility Research Institute, SFRI-2025-07 (the regulatory table on van.com.pk).
- 20 of VAN’s 23 brands hold a live PSQCA licence; the other 3 each have a stated reason.
- The certificate of analysis for any batch is free on request.

Never say: “PSQCA licensed” or a PS number for V-Compost.

“Should I use this or Humi Grow?”

The dealer says, out loud

They do 2 different jobs, and on a soil under 1% the programme can carry both. V-Compost puts organic matter itself into the soil, 5 kg a bag, at land preparation. Humi Grow is the humate fraction, concentrated, 3.2 kg of humic acid in an 8 kg bag, for the exchange sites and the root. Neither replaces the other, and neither is on the programme in place of a nutrient.

The fact behind it

- V-Compost: organic matter 25% + N 5%, 20 kg. Humi Grow: potassium humate pellets, humic acid 40%, 8 kg (the labels).
- 5 kg of organic matter in a V-Compost bag; 3.2 kg of humic acid in a Humi Grow bag (the declared analyses).
- Both are printed at land preparation on the programmes that carry them.

Never say: “The two together beat either alone.” No trial measured that.

V-Compost in the published programmes, per acre.

Crop	Stage	Rate per acre	Method	Pack
Sugarcane, February planting	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Soybean	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Chickpea	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Lentil	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Mungbean & Mash	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg

Rows as published in van.com.pk’s crop programmes, all 9 programmes that name V-Compost. Land preparation or planting on every row; drill at sowing (or broadcast) on 7, broadcasting on onion, side dressing on date palm. A rate is per acre; the crop page scales it to the field.

V-Compost in the published programmes, continued.

Crop	Stage	Rate per acre	Method	Pack
Onion	Land Preparation/Transplanting	1 bag	Broadcasting	20 kg
Banana, 1st year	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Banana, 2nd year	Land Preparation	1 bag	Drill at sowing; broadcast if no drill	20 kg
Date Palm	Year 1-2 · newly planted	2 bag	Side dressing	20 kg

Rows as published in van.com.pk's crop programmes, all 9 programmes that name V-Compost. Land preparation or planting on every row; drill at sowing (or broadcast) on 7, broadcasting on onion, side dressing on date palm. A rate is per acre; the crop page scales it to the field.

WHAT VAN WILL NOT CLAIM FOR IT

A dealer who says any of these is speaking for himself, not for VAN.

1 A yield figure, or that a field “responds” by X. No V-Compost trial exists.

2 A soil organic-matter or soil-test change from 1 bag, or from a programme of bags. 5 kg of organic matter on an acre is a root-zone input, and no measurement of a change is on file.

3 “Certified organic”, or that using it makes a crop organic. The bag is organic matter; certification is a different thing.

4 That it replaces farmyard manure by the trolley, or any tonnage equivalence.

5 That it replaces any part of the nitrogen line. 1 kg of slow nitrogen a bag is counted, never budgeted against urea.

6 A disease-suppression effect, a pathogen count or a heavy-metal figure. Screened and batch-tested is what VAN states; the limits are not yet printed.

Every batch is tested. The bag carries the proof.

1 · The batch number

It is printed on the bag. Read it to the grower and show him where it is. Every bag of every batch carries one.

2 · The certificate of analysis

For any batch, free on request. Send the batch number off the bag to kisan@van.com.pk or the helpline, and the certificate for that batch comes back. No sample to post.

3 · The laboratory

VAN Lab, PNAC LAB 336, accredited to ISO/IEC 17025:2017. Every batch is released through it before it ships. The certificate carries the laboratory's number.

What a certificate for V-Compost shows

The declared analysis tested for the batch: organic matter and nitrogen against 25% and 5%, with the batch number and the registration SFRI-2025-07 on the bag. No Pakistan Standard number is printed, because none applies. No certificate for a V-Compost batch was on file for this deck, so no batch reading is printed here; the grower asks for his own batch's certificate.

The lines a dealer says in Urdu.

The first line is the promise word from the VAN brand master. The other 3 are the deck's key sentences, translated in a first pass and not yet reviewed by VAN. Say them, and send corrections to partner@van.com.pk.

Organic matter is what lets the soil hold the fertilizer.

Urdu first pass, unreviewed

نامیاتی مادہ وہ ہے جو زمین کو کھاد روکنے کے قابل بناتا ہے

Plant residue only, screened, pressed into a pellet. 1 bag an acre at land preparation.

Urdu first pass, unreviewed

صرف پودوں کی باقیات، چھنی ہوئی، دانے کی شکل میں۔ زمین کی تیاری پر فی ایکڑ 1 تھیلا

Drill it at sowing, or work it into the soil. Left on the surface, it dries and is lost.

Urdu first pass, unreviewed

بوائی پر ڈرل کریں یا زمین میں ملائیں، سطح پر پڑا رہے تو سوکھ کر ضائع ہو جاتا ہے

1 kg of nitrogen a bag. Count it; do not cut the urea for it.

Urdu first pass, unreviewed

فی تھیلا 1 کلونائٹروجن۔ گنیں ضرور، مگر اس کے بدلے یوریا نہ گھٹائیں
