

DEALER TRAINING · SEPTEMBER 2026

V-Germinator Pro

Liquid phosphorus, P_2O_5 27 g per 100 ml, for the germinating seed and the mid-life booster.

For VAN dealers and the field team, written so a dealer can repeat it to a grower. Lahore.

What a dealer says in 30 seconds.

V-Germinator Pro is liquid phosphorus: P_2O_5 27 g in every 100 ml, with small shares of nitrogen, potash, magnesium, sulfur and iron, black, acidic at pH 2 to 4, fully soluble, in a plant-based carrier, in an 8 L pack. On calcareous ground a phosphate granule meets calcium within centimetres and waits in the soil for a root that may arrive too late. A liquid goes with the water to the root at the moment it is asked for. It is built for 2 moments: the germinating seedling, whose first roots need phosphorus before anything else, and the mid-life booster, about 40 days after the first phosphate went in, when the basal granule has been locked and the crop is still asking. It goes through the water. It is a booster on top of the basal phosphate, never instead of it. And it is never mixed with zinc.

The 4 things it must contain

1

The pack: 8 L, P_2O_5 27% w/v with N 4.5, K_2O 2, Mg 0.5, S 2, Fe 0.5. PS 5469-2020. 2.16 kg of P_2O_5 in a pack.

2

The soil: calcareous ground locks a granule's phosphate before the root arrives. A liquid arrives with the water, when it is asked for.

3

The 2 moments: germination, and the mid-life booster about 40 days after the first phosphate. Through the water.

4

The 2 rules: on top of the basal phosphate, never instead of it. Never in the same tank as zinc.

Say it in the grower's own words. Every figure in these 30 seconds is on the bag, in the published crop programme, or in the named evidence on the slides that follow.

THE BAG

What the pack says, and what it is registered as.

8 L

the pack on the price sheet. 2.16 kg of P₂O₅ in every pack, from the declared analysis.

Mg 0.5 · S 2 · Fe 0.5

magnesium 5 g, sulfur 20 g and iron 5 g per litre, all declared. Iron rides with the phosphate on purpose.

P₂O₅ 27%

w/v: 27 g in every 100 ml, 270 g in a litre. The headline nutrient.

pH 2 to 4

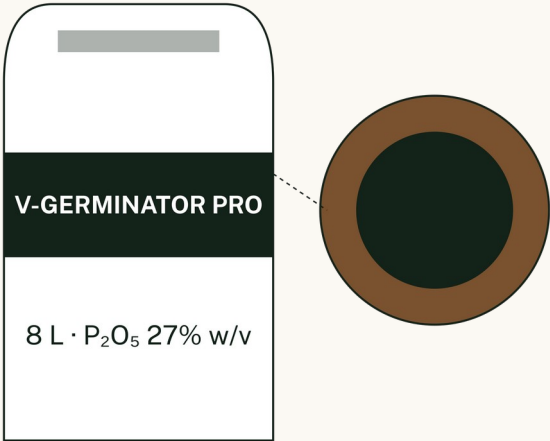

acidic, black, 100% soluble, as VAN's product data gives it. The acid is what keeps the phosphate in solution to the root.

N 4.5 · K₂O 2

nitrogen 45 g and potash 20 g per litre. Passengers, not the point of the bottle.

Fertigation

the route VAN names. Through the drip or flood water, to the root zone.

Registered as	Pakistan Standard	Manufacturing licence
V-Germinator Pro	PS 5469-2020	CM/L-4300/2026

No expiry date is printed in this deck. The licence number is what a dealer quotes.

A GROWER'S QUESTION

“I put DAP in at sowing. 40 days on, the crop is slow and the leaves have a purple edge. The DAP is in the ground. Why is the crop not getting it?”

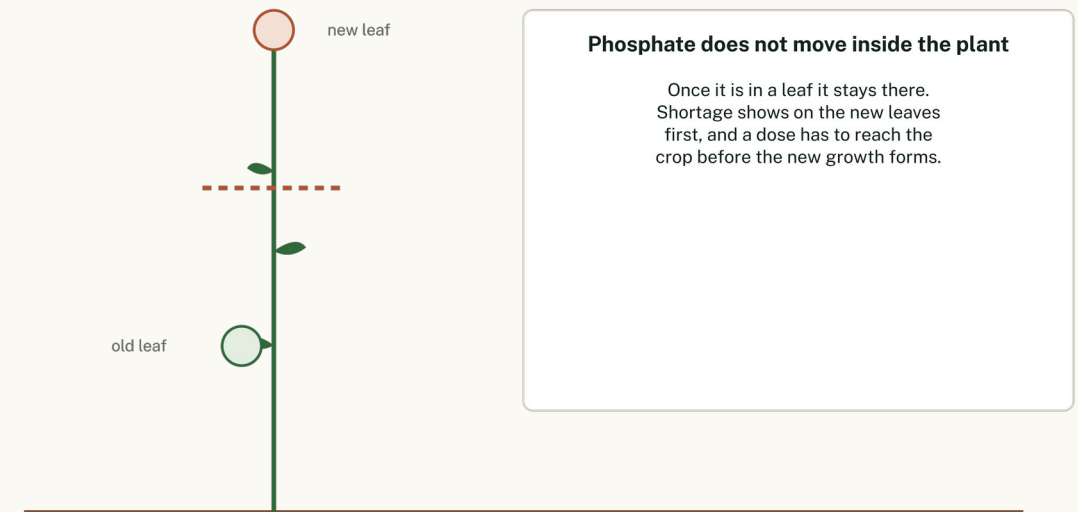

The grower did the basal phosphate. What failed was where it went: on calcareous ground the granule was locked before the root reached it, and now the crop is asking again. The answer is 3 ideas: what calcareous soil does to a granule, the 2 moments a liquid is built for, and what is in the bottle that makes it arrive.

The 3 answers on the next 3 slides, 1 idea each.

On calcareous ground a granule waits, and the root arrives late.

Phosphate hardly moves in soil. Dissolving out of a granule above pH 8, it meets calcium within a few centimetres and drops out of solution before a root arrives; the first forms are still fairly available and the loss is their slow ageing into forms the root cannot use. So a granule has to be exactly where the root will grow, and it has to survive the weeks until the root gets there. 69.1% of Punjab samples read above pH 8 and 59.1% read low in phosphorus. A liquid does not wait in the soil: it goes with the water to the wet root zone, at the moment the crop is asking.

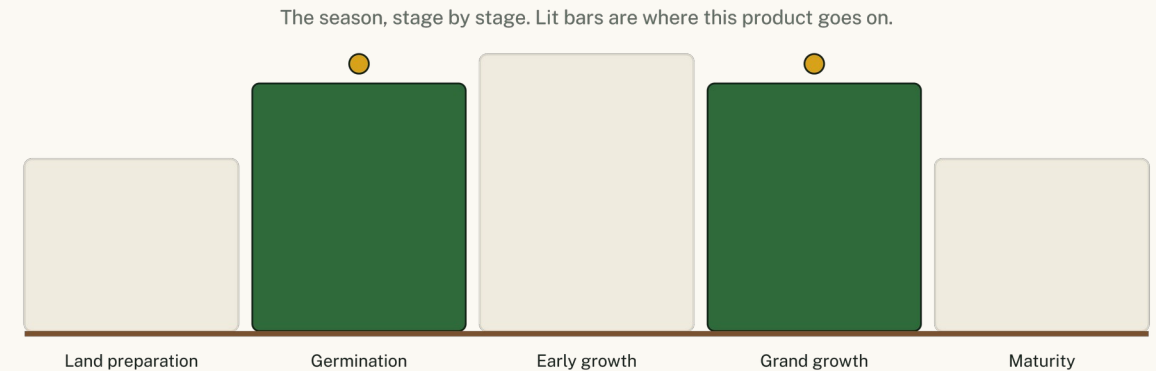

Say it like this: “Your DAP is not gone. It is locked a few centimetres from where the root needed it. This goes with the water to the root.”

Phosphate drawn as immobile in the soil: it stays where it lands. General soil chemistry, not a VAN measurement.

2 moments a granule cannot reach: germination, and the mid-life booster.

A seedling needs phosphorus before anything else: it pays for the uptake of every other nutrient and builds the first roots, and what is lost in the first weeks is not made up later. That is the first moment. The second is mid-life: VAN's guidance is about 40 days after the first phosphate application, when the basal granule has been locked and the crop is setting the parts that will fill. V-Germinator Pro is the same bottle for both, on top of the basal phosphate, never instead of it. Timing beats rate: a modest dose inside the window beats a large one outside it.

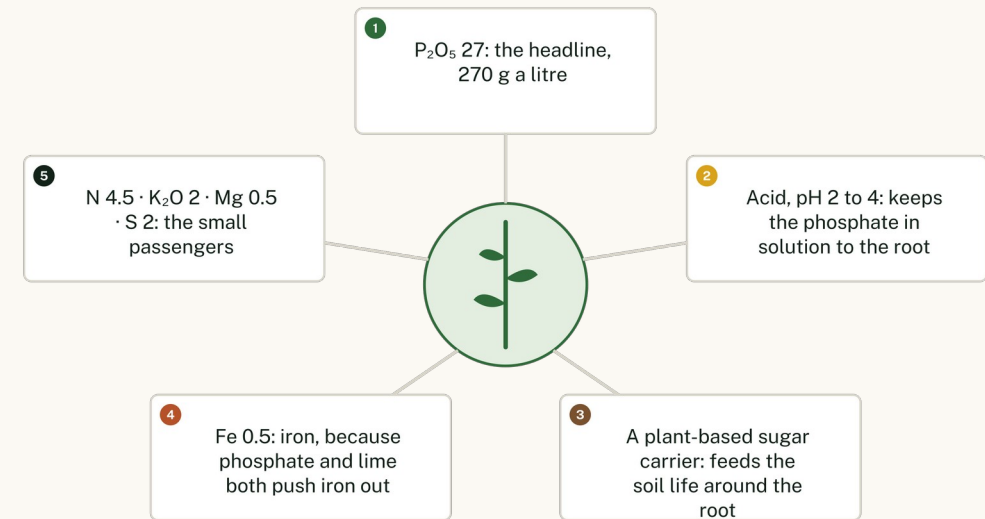

The 2 windows on the season bar. The stages are VAN's guidance by crop group; no published programme carries a row for this bottle yet.

Say it like this: "Once for the seedling, once at mid-life. On top of the basal bag, not in place of it."

What is in the bottle: acid to keep it in solution, sugar for the soil life, iron for the passenger.

The phosphate is carried at pH 2 to 4, so it stays in solution in alkaline irrigation water all the way to the root instead of meeting free calcium in the tank. The carrier is plant-based and rich in sugars; as general soil biology, sugars feed the microbes around the root, and microbial activity is what turns held phosphorus back into forms a root can take. Iron is declared with it because phosphate pushes iron out of a plant and lime pushes it out of the soil. Take the acid towards neutral in the tank and the phosphate drops out; that is why it is never mixed with zinc, which precipitates with phosphate and can block the line.

The 5 parts of the litre, from VAN's product data. No percentage of phosphate saved is drawn or said.

Say it like this: "The acid keeps the phosphate liquid until the root.
Never put zinc in the same tank."

What is verified for V-Germinator Pro, and what is not.

No trial of V-Germinator Pro is on VAN's record, and no published programme names it. What a dealer may state as fact is the pack, the licence, the soil record and the soil chemistry, each as what it is.

Item	What it says	How a dealer may use it
The pack	V-Germinator Pro, P ₂ O ₅ 27% w/v (270 g/L), N 4.5%, K ₂ O 2%, Mg 0.5%, S 2%, Fe 0.5%; black liquid, pH 2 to 4, 100% soluble, plant-based carrier; 8 L.	As fact. Read the 6 nutrients off the pack in hand.
The licence	Pakistan Standard PS 5469-2020 for liquid nutrient supplements; manufacturing licence CM/L-4300/2026.	As fact. The number, never an expiry date.
VAN's phosphate range	VAN publishes 4 routes past soil fixation. V-Germinator Pro is the liquid fertigation route, "germination / phosphate booster", beside Green Phosphate and Fusion Phosphate (soil, basal) and V-Phosphate (fertigation, solid).	As VAN publishes it: where this bottle sits in the range.
VAN guidance, 23 July 2026	Apply about 40 days after the first phosphate application, or at mid-life, as a booster on top of the basal granule. Crop-group stages: 1 week after planting then before and after flowering (fruiting vegetables); tuber initiation (potato); 2 to 3 leaves (maize).	Spoken as VAN's guidance. No dose.
The soil record (Punjab, 770,160 samples)	Mean available phosphorus 6.62 ppm; 59.1% of samples low; 97.9% below adequate; 69.1% above pH 8; mean calcium carbonate 6.53%.	As fact about the soil. Never as product performance.
Not on file	A V-Germinator Pro trial; a germination, emergence or yield figure; a dose per acre; a percentage of phosphate fixed or saved; a programme row.	Not said until named.

Sources: the pack; the Pakistan Standard and licence register; VAN's phosphate range page on van.com.pk; the VAN farmer price sheet, Aug 2026; the Punjab soil record (770,160 samples); VAN guidance, 23 July 2026.

The pack, in grams, in the grower’s own back-of-envelope.

Price from the VAN farmer price sheet, Aug 2026, delivered farmer price. Nutrients from the declared analysis, w/v: 27% is 270 g in a litre.

V-Germinator Pro	Volume	P ₂ O ₅	N	K ₂ O	Mg	S	Fe	Rupees
1 litre	1 L	270 g	45 g	20 g	5 g	20 g	5 g	569
1 pack	8 L	2.16 kg	360 g	160 g	40 g	160 g	40 g	4,550

An 8 L pack carries 2.16 kg of P₂O₅ that goes with the water to the root, for 4,550 rupees. How much of the pack goes on an acre is the dose, and VAN has not published one for this bottle; the dealer asks VAN, and does not guess. What the crop does with it is not a number VAN prints.

V-Germinator Pro 8 L PKR 4,550: the VAN farmer price sheet, Aug 2026; 569 = 4,550 ÷ 8. 270 g = 1,000 ml × 0.27; 2.16 kg = 8 × 0.27; 45 g = 1,000 × 0.045; 5 g = 1,000 × 0.005. Analysis as declared on the pack.

The scale of the job: what a crop takes off, beside what the pack carries.

Removal per tonne from the IPNI removal tables VAN’s balance block uses. The pack is a booster at 2 moments; the season’s phosphate is the basal bag in the ground.

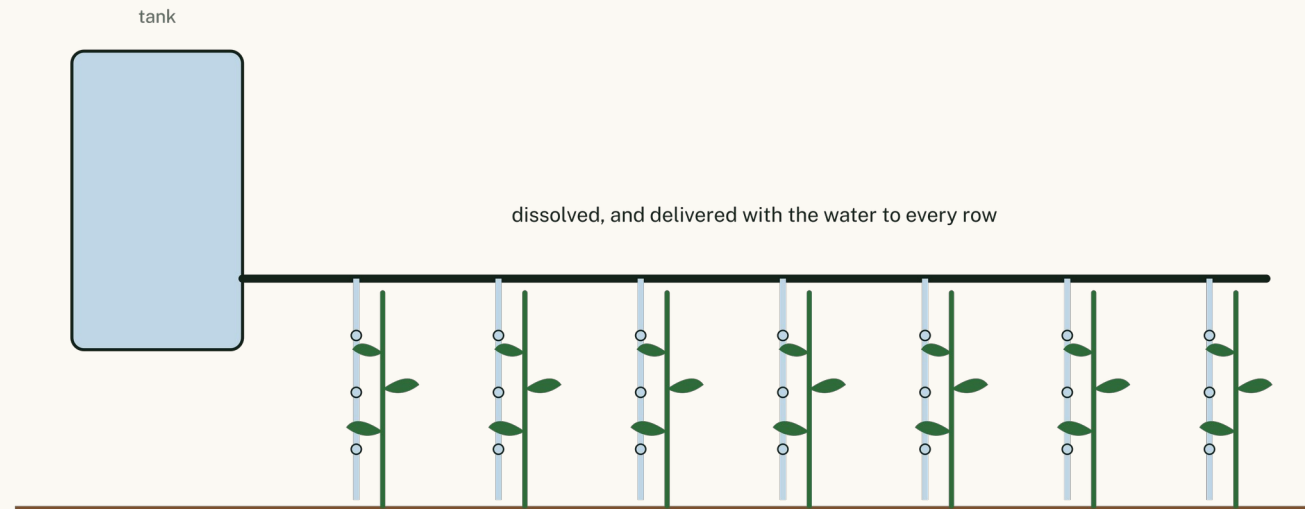

Crop	P ₂ O ₅ taken off per tonne	P ₂ O ₅ at a stated yield	What it is set against
Maize grain	6.3 kg	31.5 kg at 5 t	The basal phosphate at land preparation
Potato tubers	1.5 kg	15 kg at 10 t	The basal phosphate at land preparation
Wheat grain	8.0 kg	12.8 kg at 1.6 t (40 maunds)	The basal phosphate at land preparation
V-Germinator Pro, 1 pack of 8 L, carries		2.16 kg	A booster: germination, and mid-life

The pack is not the crop’s phosphate budget and VAN does not sell it as one. It is the part that arrives at the seedling and at mid-life, in solution, when the basal granule is locked. Keep the basal bag. Add the bottle at the 2 moments.

Removal per tonne: the IPNI removal tables (metric 01/15): maize grain 6.3, potato tuber 1.5, wheat grain 8.0 kg P₂O₅ per tonne. Yields are illustrative multiples, not VAN figures. 2.16 kg = 8 × 0.27.

HOW IT GOES ON

Through the water, at the 2 moments. Never with zinc. Do not neutralise it.

Measure it, dissolve it, keep it acidic

The dose is VAN's to give for the crop; ask, do not guess. Into the drum at the head of the watercourse or the drip tank, with the water flowing. It is fully soluble. Do not tank-mix it towards neutral: the pH 2 to 4 is what keeps the phosphate in solution, and neutralised phosphate drops out before the root.

Release across the whole irrigation

Open the tap so the drum empties across the irrigation, not in 1 slug, into the wet root zone across the whole acre. Zinc goes on a separate pass, never in this tank: phosphate and zinc precipitate together and can block the emitter.

At germination, and at the mid-life booster

VAN's guidance: fruiting vegetables 1 week after planting, then before and after flowering; potato at tuber initiation; maize at 2 to 3 leaves; orchards about 40 days after the first phosphate application. Through the water, the route VAN names for this bottle.

“4,550 for 8 litres? A bag of DAP has far more phosphate.”

The dealer says, out loud

It does, and the bag stays in your programme. This is a booster, the part that arrives. On calcareous ground the granule is locked a few centimetres from the root within weeks; the liquid goes with the water to the root at the moment the seedling or the mid-life crop is asking. 2.16 kg of P_2O_5 in solution, in the pack. How much goes on an acre is VAN's dose for your crop, and I will get it for you rather than guess.

The fact behind it

- V-Germinator Pro 8 L 4,550 rupees (VAN farmer price sheet, Aug 2026).
- 2.16 kg P_2O_5 per 8 L pack, from the declared analysis (the pack).
- No dose per acre is published; no crop programme on van.com.pk names the product.

Never say: “It replaces a bag of DAP”, “X% more available than DAP”, or a rupees-per-acre return. No trial, no dose, no percentage.

“Can I skip the basal phosphate and just fertigate this?”

The dealer says, out loud

No. It is a booster on top of the basal phosphate, never instead of it. The seedling's first roots and the mid-life crop get their phosphorus from this bottle at the moment they ask; the season's phosphate is the bag in the ground at land preparation. A crop that gets only the bottle gets grams when it needed kilograms.

The fact behind it

- A booster on top of the basal granule, not a substitute for it (VAN guidance, 23 July 2026).
- Maize grain takes off 6.3 kg P₂O₅ per tonne (the IPNI removal tables); the 8 L pack carries 2.16 kg.
- The basal phosphate goes in at land preparation on every VAN programme.

Never say: “Fertigate this and drop the DAP.”

OBJECTION 3 OF 7

“Can I mix it with my zinc?”

The dealer says, out loud

Never. Phosphate and zinc precipitate together as zinc phosphate: you lose both and you may block the line. That is basic chemistry and it is true of every soluble phosphate, not a weakness of this bottle. Zinc goes on a separate pass. Everything else, jar-test first.

The fact behind it

- VAN's product data: compatible with fertilizers and agrochemicals except zinc.
- Zinc and phosphorus pull against each other in the plant and in the tank (VAN's 17-nutrients page; textbook chemistry).
- Zinc phosphate is insoluble; it settles and can block an emitter.

Never say: “A little zinc is fine if you stir it.”

“Which stage, and how much?”

The dealer says, out loud

The 2 moments. Germination: fruiting vegetables a week after planting, potato at tuber initiation, maize at 2 to 3 leaves. Then the booster: about 40 days after the first phosphate went in, or at mid-life, before and after flowering on fruiting crops. That is VAN's guidance. The dose per acre is not on the plan yet; ask VAN for your crop and weigh it. A guessed dose is the commonest error in the field.

The fact behind it

- Stages by crop group: 1 week after planting, tuber initiation, 2 to 3 leaves, and the 40-day booster (VAN guidance, 23 July 2026).
- No crop programme on van.com.pk carries a V-Germinator Pro row yet.
- VAN's product page names the stage as mid-life and the job as germination / phosphate booster.

Never say: A dose per acre from memory, or “1 pack an acre”.

“Can I spray it on the leaf instead?”

The dealer says, out loud

VAN names 1 route for this bottle: fertigation, through the drip or flood water to the root. If a foliar use is on the label for your crop, VAN will give you the rate and the water volume; I will not read a spray rate off a fertigation pack. For a foliar phosphate, ask VAN which product the plan names.

The fact behind it

- VAN names fertigation as the route for V-Germinator Pro.
- No foliar rate or water volume for V-Germinator Pro is published.
- A foliar rate is a different figure from a fertigation dose, and neither is guessed.

Never say: A foliar rate for V-Germinator Pro.

“Is it registered? What is the licence?”

The dealer says, out loud

Pakistan Standard PS 5469-2020 for liquid nutrient supplements, manufacturing licence CM/L-4300/2026, VAN as the registered maker. Every batch is tested at VAN Lab, PNAC LAB 336, before it ships. Read the batch number off the pack and VAN sends you that batch's certificate, free.

The fact behind it

- V-Germinator Pro: PS 5469-2020, CM/L-4300/2026 (the licence register on van.com.pk).
- Every batch is tested at VAN Lab, PNAC LAB 336, before it ships.
- The certificate for any batch is free on request against the batch number.

Never say: An expiry date, or the carrier as if it were a certificate line.

“The crop is already purple and slow. Will this fix it this week?”

The dealer says, out loud

Purple edges on the older leaves, thin roots, a slow crop: that is what a phosphorus-short crop looks like, and the loss in the first weeks is not fully made up later. The booster is built for exactly this moment, about 40 days after the first phosphate, through the water. Put it on now as VAN's guidance says. I will not promise a number of days or a yield, because VAN has measured neither.

The fact behind it

- A phosphorus-short crop: purple tint on the older leaves, fewer tillers, late flowering; most of the damage is done in the first weeks (VAN's 17-nutrients page).
- The mid-life booster: about 40 days after the first phosphate application (VAN guidance, 23 July 2026).
- No trial or response time is on VAN's record.

Never say: “Green in a week” or any recovery figure.

V-Germinator Pro is not yet a row in a published programme.

No published crop programme on van.com.pk carries a row for V-Germinator Pro yet, so there is no rate per acre to print. VAN's guidance gives the stages by crop group: fruiting vegetables 1 week after planting and then before and after flowering; potato at tuber initiation; maize at 2 to 3 leaves; orchards about 40 days after the first phosphate application. The dose is VAN's to give for the crop; the dealer asks and does not guess.

WHAT VAN WILL NOT CLAIM FOR IT

A dealer who says any of these is speaking for himself, not for VAN.

1

A germination, emergence or yield figure. No V-Germinator Pro trial exists.

2

That 70 to 80% of applied phosphate is fixed, or that 80 to 95% of soils are deficient. Neither is on VAN's record as a printable figure; the soil record's 59.1% low is the figure a dealer may say.

3

That it replaces the basal phosphate, or beats DAP by source. It is a booster on top of the bag.

4

A dose per acre. None is published; the dealer asks VAN.

5

That the carrier "unlocks" the soil's phosphorus by a percentage. Sugar feeds soil life; nothing is measured for this product.

6

A foliar rate. VAN names fertigation.

Every batch is tested. The bag carries the proof.

1 · The batch number

It is printed on the bag. Read it to the grower and show him where it is. Every bag of every batch carries one.

2 · The certificate of analysis

For any batch, free on request. Send the batch number off the bag to kisan@van.com.pk or the helpline, and the certificate for that batch comes back. No sample to post.

3 · The laboratory

VAN Lab, PNAC LAB 336, accredited to ISO/IEC 17025:2017. Every batch is released through it before it ships. The certificate carries the laboratory's number.

What a certificate for V-Germinator Pro shows

The declared analysis tested for the batch: P_2O_5 against 27% w/v, with nitrogen, K_2O , magnesium, sulfur and iron where the certificate carries them, the batch number, the Pakistan Standard PS 5469-2020 and licence CM/L-4300/2026 on the pack. The carrier carries no label figure and is not a certificate line. No certificate for a V-Germinator Pro batch was on file for this deck, so no batch reading is printed here; the grower asks for his own batch's certificate.

The lines a dealer says in Urdu.

The first line is the promise word from the VAN brand master. The other 3 are the deck's key sentences, translated in a first pass and not yet reviewed by VAN. Say them, and send corrections to partner@van.com.pk.

REACH. The promise word for phosphorus.

Urdu first pass, unreviewed

پہلے جر، پھر سب کچھ

It goes with the water to the root, when the crop asks.

Urdu first pass, unreviewed

پانی کے ساتھ جر تک پہنچتا ہے، جب فصل مانگے

Never mix it with zinc.

Urdu first pass, unreviewed

زنک کے ساتھ کبھی نہ ملائیں

It is on top of the basal phosphate, not in place of it.
