

DEALER TRAINING · SEPTEMBER 2026

V-Potash Plus

N 10, K₂O 40, water soluble, with magnesium, boron and chelated iron, 10 kg, through the water at fill.

For VAN dealers and the field team, written so a dealer can repeat it to a grower. Lahore.

What a dealer says in 30 seconds.

V-Potash Plus is N 10, K₂O 40, fully water soluble, in a 10 kg bag, with magnesium, boron and chelated iron carried with the potash. It goes through the drip or flood water at the fill window, when the crop moves sugar into the fruit, the tuber or the grain. Pushing potash at that stage pushes magnesium and boron out at the root, and calcareous ground locks iron whatever the stage; so this bag carries the 3 with the potash, the iron held in a chelate that stays in solution above pH 8. The guava programme names it: 10 kg in September, through the water. VAN's guidance of 23 July gives 10 kg an acre on field crops and 5 kg twice on chili, tomato, banana and citrus. It is a fill-window bag, not the season's potash; the basal potash went in at land preparation.

The 4 things it must contain

1

The bag: N 10, K₂O 40, water soluble, 10 kg, PS 933-2026. 4 kg of K₂O and 1 kg of nitrogen in every bag.

2

The mechanism: potash at fill pushes magnesium and boron out at the root; this bag carries them with it, and chelated iron for calcareous ground.

3

The stage and method: the fill window, through the water. Guava in September; VAN's guidance for the rest.

4

The limits: no yield figure, no chlorosis cure, no percentage for the 3 passengers. Named, never numbered.

Say it in the grower's own words. Every figure in these 30 seconds is on the bag, in the published crop programme, or in the named evidence on the slides that follow.

THE BAG

What the bag says, and what it is registered as.

10 kg

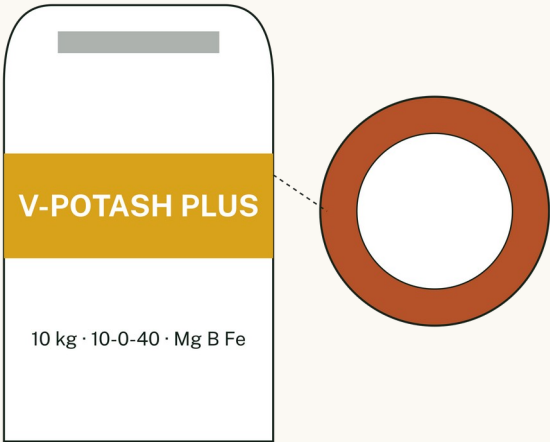

the bag, the only pack. 4.0 kg of K₂O and 1.0 kg of nitrogen in every bag, from the declared analysis.

K₂O 40%

potash, declared as 10-0-40, water soluble.

N 10%

the small nitrogen share that keeps the plant working through fill without pushing new leaf.

Mg · B

magnesium and boron carried with the potash, as van.com.pk names them. Named, never numbered: no figure is on the bag.

Chelated Fe

iron held in a chelate that stays in solution on calcareous ground, as van.com.pk names it.

Fertigation

the 1 route van.com.pk names: through the drip or flood water at the fill window. Not a basal granule, not a foliar.

Registered as	Pakistan Standard	Manufacturing licence
V-Potash Plus	PS 933-2026	CM/L-2944/2023

No expiry date is printed in this deck. The licence number is what a dealer quotes.

A GROWER'S QUESTION

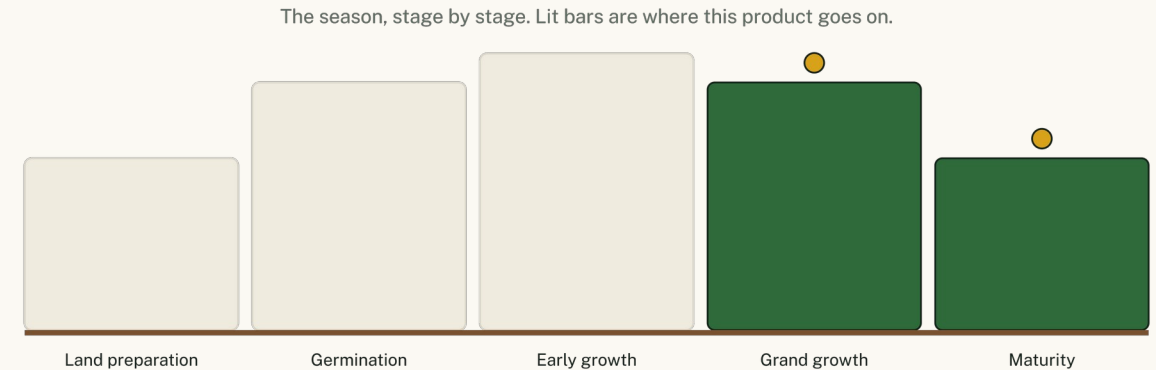

“When I push potash at fill, the new leaves go yellow and the fruit still sets badly. What is going on?”

The grower did feed potash at the right stage. What he sees is the shortage the potash itself helped make: magnesium and boron pushed out at the root, and iron that the calcareous soil never let go of. The answer is 3 ideas: potash at fill, what potash pushes out, and why the iron has to be chelated on this ground.

The 3 answers on the next 3 slides, 1 idea each.

Potash at the fill window, through the water.

The crop grows on nitrogen and fills on potash: potash moves the sugar the leaf makes into the fruit, the tuber or the grain, and thickens the cell wall against heat, drought and disease. V-Potash Plus is K₂O 40 with a small nitrogen share of 10, fully water soluble, so it goes through the drip or flood water at grand growth and maturity, when the crop has stopped building leaf and started filling. The basal potash went in at land preparation. This is a fill-window bag, a stage top-up, not the season's potash.

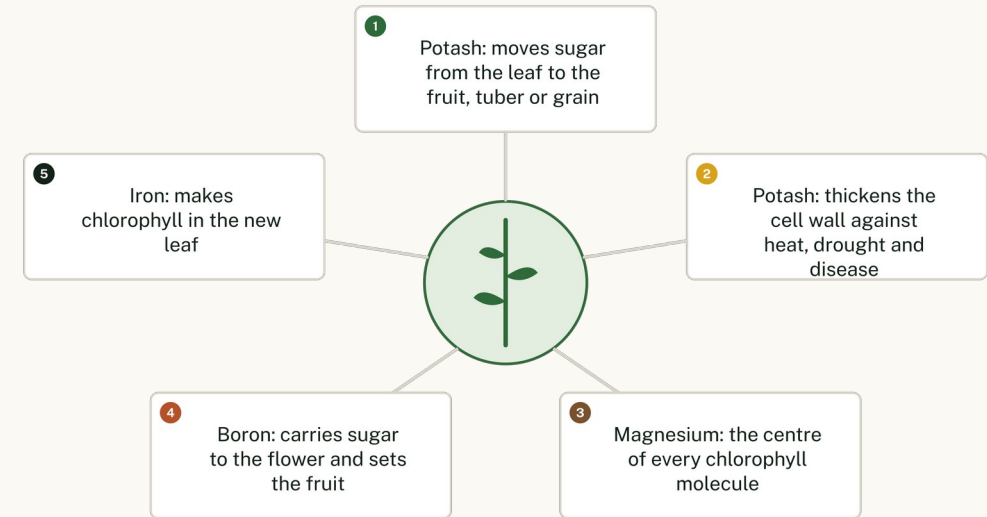

The 5 stage names are the programme's. Guava takes it in September; the other crops follow VAN's guidance of 23 July 2026.

Say it like this: "Put it through the water when the crop starts to fill. The basal potash is a different bag, and it went in at land preparation."

Push potash, and magnesium and boron fall behind. So they ride with it.

Too much potash at the root pushes out magnesium and calcium, and boron with them. Magnesium sits at the centre of every chlorophyll molecule: no magnesium, no green, no sugar. Boron carries sugar to the flower and sets the seed and the fruit; a boll, a head or a panicle that sets badly is often a boron story. A programme that raises potash without them often shows the shortage the same season. V-Potash Plus carries magnesium and boron in the same bag as the potash, so the correction arrives at the same moment as the cause. They are named, never numbered, because no figure is on the bag.

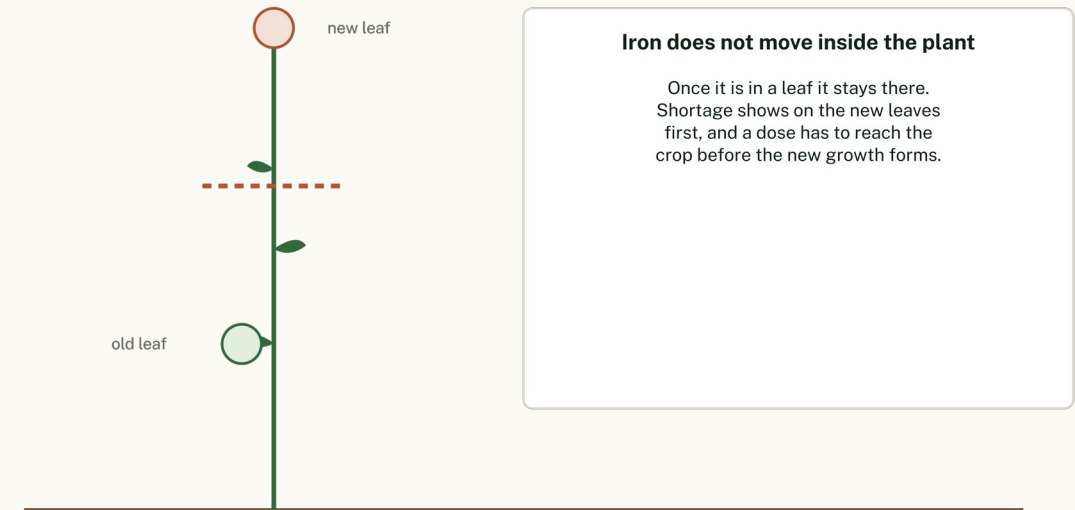

The 5 jobs from the 17-nutrients page on van.com.pk. A picture of the idea, not a measurement.

Say it like this: “Potash alone at fill can starve the crop of magnesium and boron. This bag brings them with it.”

On calcareous ground the iron has to be chelated, or the soil keeps it.

Iron makes chlorophyll and runs the enzymes that move electrons; a leaf without it cannot turn light into sugar. It does not move inside the plant once it is placed, so the youngest leaves go yellow between the veins first while the old leaves stay green. Pakistani soil is usually full of iron the root cannot drink: lime in the soil and bicarbonate in the irrigation water lock it above pH 8, and 69.1% of Punjab samples read above pH 8. Plain iron salts drop out of solution on that ground. A chelate holds the iron in solution at high pH long enough for the root to take it. That is why the iron in this bag is chelated, and why the bag costs what it costs.

Say it like this: “Your soil is full of iron the root cannot drink. The chelate keeps it drinkable long enough to reach the root. That is what you are paying for.”

Iron is immobile in the plant: the new leaf shows the shortage first. General soil chemistry, no VAN measurement, no figure.

THE EVIDENCE

What is verified for V-Potash Plus, and what is not.

No trial of V-Potash Plus is on VAN's record. What a dealer may state as fact is the bag, the licence, the soil record and the published potash research, each as what it is.

Item	What it says	How a dealer may use it
The bag	V-Potash Plus, N 10%, K ₂ O 40%, water soluble, 10 kg, with magnesium, boron and chelated iron as van.com.pk names them.	As fact. The 3 passengers named, never numbered.
The licence	Pakistan Standard PS 933-2026 for multinutrient fertilizer; manufacturing licence CM/L-2944/2023.	As fact. The number, never an expiry date. VAN keeps it current.
The soil record (Punjab, 770,160 samples)	69.1% of samples above pH 8; 87.8% below the working threshold for available potash; 51.7% low in boron. Iron is on VAN's soil report and the Soil Atlas.	As fact about the soil. Never as product performance.
National potash use	Potash is 1% of Pakistan's nutrient use (the Crop Force bag). About 1 kg of potash for every 83 kg of nitrogen (van.com.pk).	As fact.
Published research, not VAN trials	Sindh banana (Memon et al. 2010): correcting potash alone lifted yield from 51.2 to 60.8 t/ha. Multan cotton (Hussain, Ali and Gardezi 2021): soil potassium reduced boll shedding.	Spoken, as research on potash. Never as a V-Potash Plus result.
Not on file	A trial; a yield figure; a magnesium, boron or iron figure on a pack seen for this deck; a programme row beyond guava; a chlorosis result.	Not said.

Sources: the bag and the product page on van.com.pk; the PSQCA register as van.com.pk prints it; the Crop Force bag; the Punjab soil testing programme (36 district workbooks, 770,160 samples); Memon et al. 2010; Hussain, Ali and Gardezi 2021.

The bag, and the guava application, in the grower’s own back-of-envelope.

Price from the VAN farmer price sheet, Aug 2026, delivered farmer price. K₂O and nitrogen from the declared analysis. Magnesium, boron and iron carry no figure.

V-Potash Plus, N 10 · K ₂ O 40	Weight	K ₂ O	Nitrogen	Rupees
1 bag	10 kg	4.0 kg	1.0 kg	5,000
Guava, 10 kg an acre in September (the programme)	10 kg	4.0 kg	1.0 kg	5,000
Chili, tomato, banana, citrus: 5 kg twice (VAN guidance)	10 kg	4.0 kg	1.0 kg	5,000

On guava the grower spends 5,000 rupees an acre to put 4 kg of K₂O through the water in September, with magnesium, boron and chelated iron riding on it. That is the counter arithmetic. What it does for his fruit is not a number VAN prints.

V-Potash Plus 10 kg PKR 5,000: the VAN farmer price sheet, Aug 2026. 4.0 kg = 10 × 0.40; 1.0 kg = 10 × 0.10. Guava: the crop programmes on van.com.pk, September, 10 kg, fertigation. Other crops: VAN’s dose guidance of 23 July 2026.

The 3 potash bags are 3 jobs, not 1 choice.

Bag prices side by side from the VAN farmer price sheet, Aug 2026. The dealer sells the stage and the job, never the kilogram.

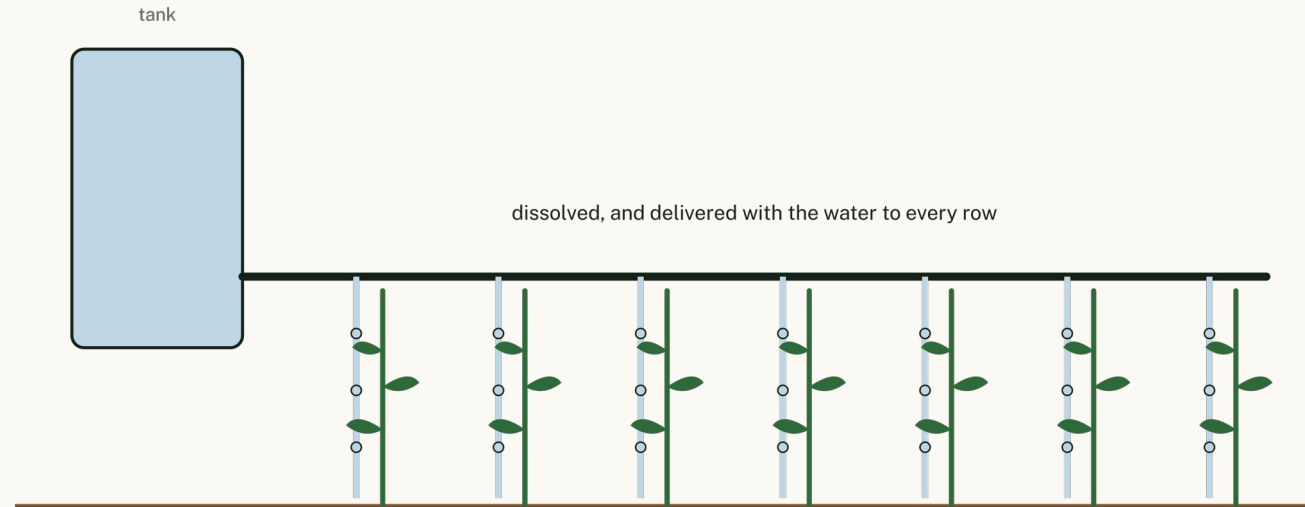

Product	Bag	K ₂ O in the bag	Stage and method	Rupees
V-Potash Plus, N 10 · K₂O 40 + Mg, B, chelated Fe	10 kg	4.0 kg	Fill window, through the water; guava in September	5,000
Vital Potash, N 11 · K₂O 44 + B in 2 forms	20 kg	8.8 kg	Grand growth and maturity, through the water	10,500
Fusion Potash, K₂O 50 with S, B, Mg	25 kg	12.5 kg	Land preparation, drilled or broadcast	11,500

V-Potash Plus and Vital Potash are both fill-window bags through the water: V-Potash Plus where magnesium and iron are the worry on calcareous ground, Vital Potash on the 27 programmes that name it. Fusion Potash is the basal bag. If you compare V-Potash Plus on potash alone it looks expensive; the chelated iron is the part you are paying for.

Prices: the VAN farmer price sheet, Aug 2026, V-Potash Plus 10 kg 5,000; Vital Potash 20 kg 10,500; Fusion Potash 25 kg 11,500. K₂O per bag from the declared analyses.

HOW IT GOES ON

Through the water, at the fill window. Dissolve it fully first.

Weigh it, then dissolve it

10 kg an acre, or 5 kg where the guidance splits it; weigh it, a guessed dose is the commonest error in the field. Into the drum at the head of the watercourse or the drip tank; stir until it is fully in solution. Undissolved product settles and blocks the tap.

Release with the water flowing

Open the tap so the drum empties across the whole irrigation, not in 1 slug. The water carries it into the wet root zone across the whole acre.

At the fill window, split where the guidance says

Guava: 10 kg in September, the programme row. VAN's guidance of 23 July 2026: 10 kg once on field crops such as cotton; 5 kg twice on chili, tomato, banana and citrus, because iron chlorosis comes back. Not at sowing: the basal potash is a different bag. No foliar rate is printed.

OBJECTION 1 OF 7

“5,000 for 10 kg? That is 4 kg of potash.”

The dealer says, out loud

Yes, and if you compare it on potash alone it will look expensive. You are buying the 3 things that ride with the potash at fill: magnesium and boron, which a potash push would otherwise starve the crop of, and iron held in a chelate that stays drinkable on calcareous ground. Compare it against a fill potash plus a separate chelated iron application, and write the job beside each. What it does for your fruit is not a number VAN prints.

The fact behind it

- V-Potash Plus 10 kg PKR 5,000 (VAN farmer price sheet, Aug 2026).
- 4.0 kg K₂O and 1.0 kg N per bag, from the declared analysis; Mg, B and Fe named, never numbered.
- Chelated iron is the costly part of the formulation, and it is the reason for the price (the product page on van.com.pk).

Never say: “It gives you X more fruit” or a rupees-per-acre return. No yield figure exists for the product.

“Vital Potash or V-Potash Plus? Both go on at fill.”

The dealer says, out loud

Both are fill-window bags through the water. Vital Potash is N 11, K₂O 44, with boron in 2 forms, and it is on 27 programmes; that is the fill line for most crops. V-Potash Plus carries less potash per bag and adds magnesium and chelated iron, for crops and ground where the new leaf goes yellow at fill. The guava programme names it. For your crop, the programme decides; if it names Vital Potash, that is the bag.

The fact behind it

- Vital Potash: N 11 · K₂O 44, 20 kg, boron in 2 forms; V-Potash Plus: 10-0-40 + Mg · B · chelated Fe, 10 kg (the product pages on van.com.pk).
- Guava is the only programme that names V-Potash Plus; Vital Potash is on 27 programmes (the crop programmes on van.com.pk).
- Both are fertigated at the fill window; neither is the basal bag.

Never say: “V-Potash Plus is the better potash.” It is a different bag for a different worry.

OBJECTION 3 OF 7

“My new leaves are yellow between the veins. Will this green them?”

The dealer says, out loud

Yellow between the veins on the youngest leaf on calcareous ground is often an iron story, and this bag carries chelated iron with the potash for exactly that ground. Put it on at the fill window as the guidance says, split in 2 on chili, tomato, banana and citrus because the yellowing comes back. I will not promise it greens the leaf by a date: VAN prints no chlorosis cure and no day figure, because no trial of this product measured one. Send VAN a photo of the leaf with your question.

The fact behind it

- Iron shortage shows as young leaves yellow between the veins with the veins sharply green; lime and bicarbonate lock iron (the 17 nutrients page on van.com.pk).
- The 5 kg twice split on iron-responsive horticulture exists because iron chlorosis recurs (VAN guidance, 23 July 2026).
- No trial and no figure exist for the product.

Never say: “It cures chlorosis” or “green in 7 days”.

“Can I put it on at sowing with my basal potash?”

The dealer says, out loud

No. It is built for the fill window, when the crop moves sugar into the fruit and pushes hardest on magnesium and boron. Put on at sowing it arrives months early for the job it was built for, and the chelated iron is wasted on a root that is not yet there. The basal potash at land preparation is Fusion Potash or SOP. This bag goes through the water at fill.

The fact behind it

- The product page gives 1 stage, mid-life, and 1 method, fertigation (van.com.pk).
- A mid-life product applied at sowing is early for the peak it was built for (VAN guidance, 23 July 2026).
- The basal potash bags are Fusion Potash and SOP, at land preparation (the crop programmes on van.com.pk).

Never say: “Put it on whenever you have water.”

OBJECTION 5 OF 7

“Can I spray it on the leaf, or fly it?”

The dealer says, out loud

The 1 route van.com.pk names is fertigation: dissolved and put through the drip or flood water. No programme names a foliar rate for it and I will not give you one. It is not in VAN's drone family; if a product is meant to be flown, VAN names it there.

The fact behind it

- The product page lists 1 method: fertigation (van.com.pk).
- A product meant to be flown is named into VAN's One Tank family; V-Potash Plus is not (the application systems page on van.com.pk).
- No foliar rate for it is published anywhere on van.com.pk.

Never say: A foliar or drone rate.

“How many bags, and which crops?”

The dealer says, out loud

Guava: 10 kg an acre in September, through the water; that is the programme row. For other crops the programme does not name it yet; VAN's guidance of 23 July is 10 kg once on field crops such as cotton, and 5 kg twice on chili, tomato, banana and citrus. The bag is always 10 kg. More than the guidance is more boron than the crop asked for; the window for boron is narrow.

The fact behind it

- Guava: September, 10 kg, fertigation, 10 kg bag (the crop programmes on van.com.pk).
- VAN's dose guidance of 23 July 2026: 10 kg on field crops; 5 + 5 kg on chili, tomato, banana and citrus.
- The bag comes in 1 size, 10 kg (the farmer price sheet, Aug 2026).

Never say: A rate or crop the guidance does not name, or “double it”.

“Is it registered? What is the licence?”

The dealer says, out loud

Pakistan Standard PS 933-2026 for multnutrient fertilizer, manufacturing licence CM/L-2944/2023, VAN as the registered maker. Every batch is tested at VAN Lab, PNAC LAB 336, before it ships. Read the batch number off the bag and VAN sends you that batch's certificate, free.

The fact behind it

- V-Potash Plus: PS 933-2026, CM/L-2944/2023 (the regulatory table on van.com.pk).
- Every batch is released through VAN Lab, PNAC LAB 336 (the corporate profile).
- The certificate of analysis for any batch is free on request, by batch number.

Never say: An expiry date. The dealer quotes the number and VAN keeps it current.

WHERE IT SITS IN THE CROP PROGRAMME

V-Potash Plus in the published programmes, per acre.

Crop	Stage	Rate per acre	Method	Pack
Guava	September	10 kg	Fertigation	10 kg

WHAT VAN WILL NOT CLAIM FOR IT

A dealer who says any of these is speaking for himself, not for VAN.

1

A yield figure, a fruit-set figure or a chlorosis cure. No trial of the product exists.

2

A percentage or ppm for magnesium, boron or iron. They are named, never numbered.

3

That it is the season's potash or a basal bag. It is a fill-window bag; Fusion Potash or SOP is the basal line.

4

A foliar or drone rate. Fertigation is the 1 route van.com.pk names.

5

That the chelate makes iron “work on any soil”, or a day figure for greening. General chemistry only, no measurement.

6

A licence expiry date. The dealer quotes CM/L-2944/2023; VAN keeps it current.

Every batch is tested. The bag carries the proof.

1 · The batch number

It is printed on the bag. Read it to the grower and show him where it is. Every bag of every batch carries one.

2 · The certificate of analysis

For any batch, free on request. Send the batch number off the bag to kisan@van.com.pk or the helpline, and the certificate for that batch comes back. No sample to post.

3 · The laboratory

VAN Lab, PNAC LAB 336, accredited to ISO/IEC 17025:2017. Every batch is released through it before it ships. The certificate carries the laboratory's number.

What a certificate for V-Potash Plus shows

The declared analysis tested for the batch: nitrogen and K₂O against 10-0-40, with the batch number, the Pakistan Standard PS 933-2026 and licence CM/L-2944/2023 on the bag. Magnesium, boron and iron appear on the certificate only if the registered analysis carries them; no figure for them is in this deck. No certificate for a V-Potash Plus batch was on file for this deck, so no batch reading is printed here; the grower asks for his own batch's certificate.

The lines a dealer says in Urdu.

The first line is the promise word from the VAN brand master. The other 3 are the deck's key sentences, translated in a first pass and not yet reviewed by VAN. Say them, and send corrections to partner@van.com.pk.

GUARD. The promise word for potash.

Urdu first pass, unreviewed

فصل کی ڈھال

Push potash hard and magnesium and boron fall behind.

Urdu first pass, unreviewed

پوٹاش زور سے دیں تو میگنیشیم اور بوران پیچھے رہ جاتے ہیں

This bag carries magnesium, boron and chelated iron with the potash.

Urdu first pass, unreviewed

اس تھیلے میں پوٹاش کے ساتھ میگنیشیم، بوران اور چیلٹڈ لوہا ہے

Give it with the water when the fruit fills.

Urdu first pass, unreviewed

جب پھل بھرنے لگے تو پانی کے ساتھ دیں
