

DEALER TRAINING · SEPTEMBER 2026

V-Zinc 10%

Liquid zinc sulfate, 100 g of zinc in a litre, through the water at germination or on the leaf.

For VAN dealers and the field team, written so a dealer can repeat it to a grower. Lahore.

What a dealer says in 30 seconds.

V-Zinc 10% is zinc in a liquid: zinc sulfate, 10% weight in volume, so 100 g of zinc in every litre, fully soluble, no residue in the tank or the emitter. Zinc makes the growth hormone that lengthens the stem and the enzymes that build protein; it decides plant height, leaf size and, in rice and wheat, grain set. On calcareous ground above pH 8 the soil locks zinc as zinc phosphate or on the lime, and 59.0% of Punjab samples already read low. So this zinc goes in as a solution, through the water at germination on sugarcane, rice, tomato and banana, or as a spray on the pulses, at the plan's rate. Early, while the plant is still deciding its size. It is the liquid zinc; the granule for the soil at sowing is V-Transform.

The 4 things it must contain

1

The pack: 3 L, Zn 10% w/v as zinc sulfate, PS 5469-2020. 300 g of zinc in the pack, 100 g in every litre. 20 L and 200 L too.

2

The nutrient: the growth hormone, leaf size, protein and grain set. 59.0% of Punjab samples read low in zinc.

3

The stage: germination and early growth, through the water or on the leaf, at the row the plan prints.

4

The rule: never in the same tank as a soluble phosphate. Zinc phosphate does not dissolve.

Say it in the grower's own words. Every figure in these 30 seconds is on the bag, in the published crop programme, or in the named evidence on the slides that follow.

THE BAG

What the pack says, and what it is registered as.

3 L

the pack every programme row is written in. 300 g of zinc in it, from the declared analysis. 20 L and 200 L packs are on the price sheet.

Zn 10%

zinc, w/v: 100 g in every litre, as zinc sulfate. The programme rows print it as "Zinc 10% w/v".

Sulfate

the salt. In solution the moment it meets water; taken up on the leaf directly. The site's registered analysis says zinc sulfate, and this deck says no more about the form than that.

2 routes

fertigation on 11 rows, spray on 3, as the programmes print them. Germination and early growth.

59.0%

of 770,160 Punjab samples read below 1.0 ppm zinc; mean 1.25 ppm, and it falls as pH rises.

12

published programmes name V-Zinc, 14 rows, all in the 3 L pack.

Registered as	Pakistan Standard	Manufacturing licence
V-Zinc 10%	PS 5469-2020	CM/L-3130/2024

No expiry date is printed in this deck. The licence number is what a dealer quotes.

A GROWER'S QUESTION

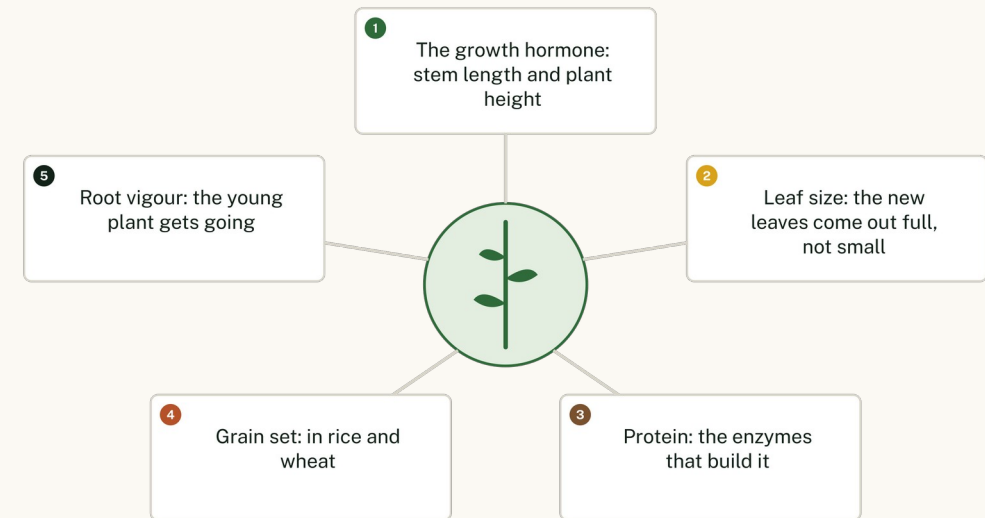

“The rice nursery has brown spots and the plants stay short. In the maize a white band runs down the young leaf. I gave both their urea. What is it?”

The grower is describing zinc, in the 2 crops that show it most clearly, on the ground that locks it most. He fed nitrogen and the crop cannot use it, because the small nutrient that runs the growth is short. The answer is 3 ideas: what zinc does, why calcareous soil starves the crop of it, and why a solution at germination reaches the crop.

The 3 answers on the next 3 slides, 1 idea each.

Zinc runs the growth. A short crop is a zinc sign.

Zinc makes the growth hormone that lengthens the stem and the enzymes that build protein. It decides plant height, leaf size and, in rice and wheat, grain set. A crop short of it comes out with small, narrow young leaves, yellow between the veins, short joints that make the plant look bunched, a white band down the young maize leaf, brown spots on the older rice leaves in the nursery. A field can be full of nitrogen and still stop at the zinc.

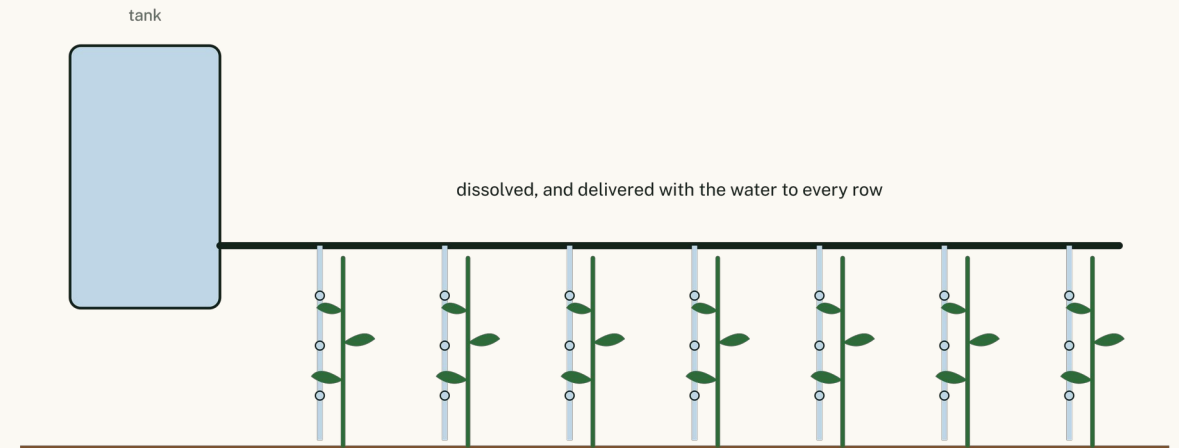

The jobs of zinc, from the site's 17-nutrients page. A picture of the idea, not a measurement.

Say it like this: “Zinc is what makes the plant grow tall and the leaf come out full. Without it the crop stays small, however much urea you give it.”

The soil has zinc and locks it. Above pH 8, most of all.

On calcareous ground above pH 8, zinc is fixed as zinc phosphate or held on the calcium carbonate, so the root cannot drink it even when the soil holds enough in total. 69.1% of Punjab samples read above pH 8, 59.0% read low in zinc, and the survey shows zinc falling as pH rises and dropping sharply where the lime is above 3%. Decades of phosphate on that ground make it worse, because zinc and phosphorus pull against each other. A solution put in with the water reaches the wet root zone as zinc the root can take, and a spray reaches the leaf, where the soil never gets a vote.

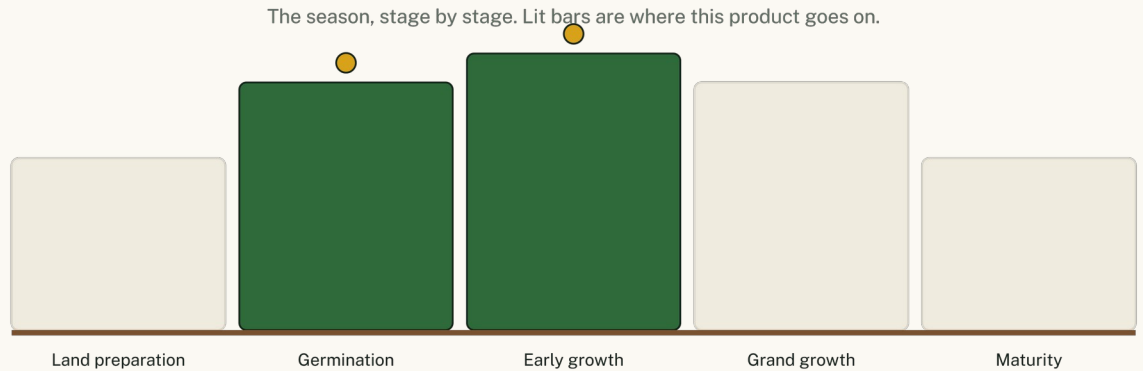

Say it like this: “Your soil is not empty of zinc. It is holding it where the root cannot get it. So we give it as a liquid, in the water or on the leaf.”

The fertigation line: a solution in the wet root zone. General soil chemistry and the Punjab survey; no product measurement.

At germination, while the plant is still deciding its size.

Zinc runs the enzymes of early growth and the hormone that sets how tall and how wide the plant will be. The programmes put V-Zinc at germination on sugarcane, hybrid rice, tomato, banana, turmeric and strawberry, through the water, and at early growth on mango, soybean and the pulses. A zinc correction at flowering is correcting a shortage that has already decided the size of the plant. Early, at the row the plan prints, and once more at grand growth where the banana plan says so.

The 5 stage names are the programme's. Which rows carry V-Zinc for your crop are on the programme slides.

Say it like this: "Give the zinc at germination, when the plant is deciding how big to be. Late zinc fixes a plant that has already stayed small."

THE EVIDENCE

What is verified for V-Zinc 10%, and what is not.

No trial of V-Zinc is on VAN's record. What a dealer may state as fact is the pack, the licence, the programme rows and the Punjab soil record, each as what it is.

Item	What it says	How a dealer may use it
The pack	V-Zinc 10%, zinc sulfate, Zn 10% w/v, 100 g per litre, liquid, fully soluble. 3 L; 20 L and 200 L on the price sheet.	As fact. Grams per litre from the declared analysis.
The licence	Pakistan Standard PS 5469-2020 for liquid nutrient supplements; manufacturing licence CM/L-3130/2024, as the master record holds it.	As fact. The number, never an expiry date.
The programme rows	14 rows on 12 programmes, all in the 3 L pack: 6¼ packs at germination on sugarcane and hybrid rice; 4¼ on tomato, turmeric and banana; 2 on mango and strawberry; ½ on soybean; ⅓ pack sprayed on chickpea, lentil and mungbean.	As the published rate. Verbatim.
The soil record (Punjab, 770,160 samples)	59.0% of samples below 1.0 ppm zinc; mean 1.25 ppm; zinc falls as pH rises (1.45 to 1.20 ppm) and drops where calcium carbonate is above 3%. 69.1% above pH 8.	As fact about the soil. Never as product performance.
The chemistry (textbook)	Above pH 8 zinc is fixed as zinc phosphate or on lime; zinc and a soluble phosphate in 1 tank make zinc phosphate, which does not dissolve. Zinc and phosphorus pull against each other in the soil.	As general soil chemistry, not a VAN measurement.
Not on file	A V-Zinc trial; a yield or grain-zinc figure; the 64% and 57% soil figures and the National Nutrition Survey chain printed in earlier VAN material; a 1 L foliar pack with iron, amino acids and seaweed; a drone rate; a chelate.	Not said until named.

Sources: the pack; VAN's published crop programmes on van.com.pk; the farmer price sheet, Aug 2026; the PSQCA master record; the Punjab soil record, 770,160 samples; VAN's 17-nutrients page; VAN's own product data.

The 3 packs, in grams of zinc, in the grower’s own back-of-envelope.

Prices from the VAN farmer price sheet, Aug 2026, delivered farmer price. Zinc from the declared analysis, w/v: 10% is 100 g in a litre.

V-Zinc 10%, Zn 10% w/v	Volume	Zinc	Rupees	Rupees per litre
1 pack	3 L	300 g	1,375	458
1 pack	20 L	2.0 kg	6,450	323
1 drum	200 L	20 kg	55,000	275

A 3 L pack is 300 g of zinc for 1,375 rupees. The 20 L pack is the same litre at 323 rupees, and it matters here more than on any other VAN liquid, because the germination rows on sugarcane and rice ask for 6¼ packs, which is 18.75 litres: 1 pack of 20 L covers the acre for 6,450 rupees against 8,594 in 3 L packs.

V-Zinc 3 L PKR 1,375, 20 L PKR 6,450, 200 L PKR 55,000: the farmer price sheet, Aug 2026. 300 g = 3 × 100; 2.0 kg = 20 × 0.1. Rupees per litre = price ÷ litres. 6¼ × 3 L = 18.75 L; 6¼ × 1,375 = 8,594.

What the programme puts on, per acre: the fertigation rows in kilograms.

Packs per acre from the published programmes, in the 3 L pack; zinc from the declared analysis; rupees at the VAN farmer price sheet, Aug 2026.

Crop	Stage and method, as printed	3 L packs	Litres	Zinc	Rupees per acre
Sugarcane	Germination, fertigation	6¼	18.75	1.875 kg	8,594 (6,450 as 1 × 20 L)
Hybrid rice	Germination, fertigation	6¼	18.75	1.875 kg	8,594 (6,450 as 1 × 20 L)
Banana, year 1	Germination 4¼, grand growth 2, fertigation	6¼	18.75	1.875 kg	8,594 (6,450 as 1 × 20 L)
Tomato	Germination, fertigation	4¼	12.75	1.275 kg	5,844
Turmeric	Germination, fertigation	4¼	12.75	1.275 kg	5,844

These rows put zinc on in kilograms: 1.875 kg on an acre of sugarcane through the water at germination, once, for a crop that stands a year on ground that locks zinc. At that volume the 20 L pack is the pack: 1 pack covers the acre for 6,450 rupees against 8,594 in 3 L packs.

VAN's published crop programmes on van.com.pk, rows as printed in the 3 L pack. Rupees = packs × 1,375; 20 L at 6,450 where 1 pack covers the row, farmer price sheet, Aug 2026. 1.875 kg = 18.75 L × 100 g.

What the programme puts on, per acre: the smaller rows in grams.

Packs per acre from the published programmes, in the 3 L pack; zinc from the declared analysis; rupees at the VAN farmer price sheet, Aug 2026.

Crop	Stage and method, as printed	3 L packs	Litres	Zinc	Rupees per acre
Mango	Early growth, fertigation	2	6	600 g	2,750
Strawberry	Germination, fertigation	2	6	600 g	2,750
Soybean	Early growth, fertigation	½	1.5	150 g	688
Chickpea, lentil, mungbean	Early growth, spray	⅕	0.6	60 g	275

The spray rows put zinc on in grams: 60 g on an acre of chickpea on the leaf, for 275 rupees. That is the difference between feeding the root zone through the water and correcting the leaf, in the grower's own numbers, from the same pack.

VAN's published crop programmes on van.com.pk, rows as printed in the 3 L pack. Rupees = packs × 1,375, farmer price sheet, Aug 2026.

The liquid and the granule are 2 jobs, not 1 choice.

VAN's 2 zinc products side by side from the VAN farmer price sheet, Aug 2026. The programme puts them on different crops at different stages; the grower follows his crop's row.

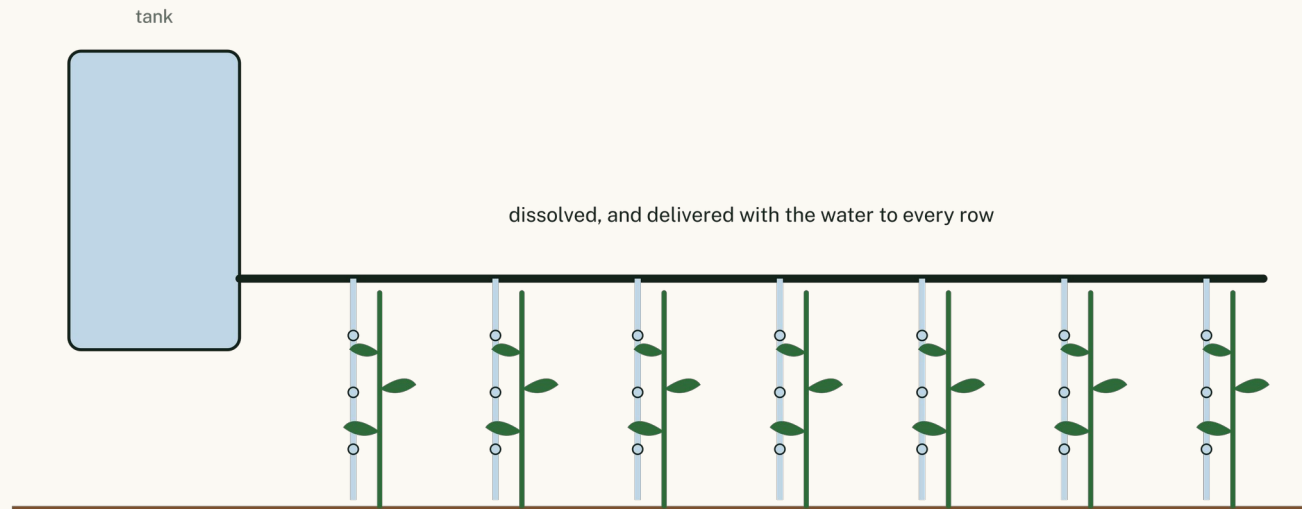

Product	Pack	Zinc in the pack	Stage and method	Rupees
V-Zinc 10%, zinc sulfate, liquid	3 L	300 g	Germination and early growth, through the water or on the leaf	1,375
V-Zinc 10%, the 20 L pack	20 L	2.0 kg	The sugarcane, rice and banana rows in 1 pack	6,450
V-Transform, zinc 21%, granular	3 kg	630 g	Germination, side-dressed or broadcast into the soil, on wheat, maize, cotton, potato, rice	1,975

The dealer sells the row, not the gram. The liquid goes in the water or on the leaf where the plan says fertigation or spray; the granule goes into the soil beside the row where the plan says side dressing. On a soil known to be short, the plan may carry both on different crops; it never swaps one for the other on the same row.

Prices: the farmer price sheet, Aug 2026: V-Zinc 3 L 1,375 and 20 L 6,450; V-Transform 3 kg 1,975. Zinc per pack from the declared analyses (Zn 10% w/v; Zn 21% w/w). Stages and methods: the crop programmes on van.com.pk.

HOW IT GOES ON

Through the water at germination, or on the leaf. Never with the phosphate.

Fertigation: dissolve, then release with the water flowing

The sugarcane, rice, tomato, turmeric, banana, mango, strawberry and soybean rows run it through the water. Into the drum at the head of the watercourse or the drip tank, stirred in, released across the whole irrigation and not in 1 slug. Fully soluble, no residue in the tank or the emitter, as VAN's product data says. For the 18.75 L rows, the 20 L pack is the pack.

Spray: water first, then the pack

Chickpea, lentil and mungbean take $\frac{1}{5}$ of a pack, 600 ml, sprayed at early growth. 100 to 200 litres of clean water an acre in the tank first, then the measured zinc, kept agitated, a fine even fan, morning or evening, never midday. The dilution is part of the rate.

Never in the same tank as a soluble phosphate

Zinc and a soluble phosphate make zinc phosphate, which does not dissolve: both are lost and the line can block. Zinc on its own pass, on its own irrigation. And never a drone rate from this deck: the drone grade is a different concentration with its own rate.

“1,375 for 3 litres? A bag of zinc sulfate powder costs less.”

The dealer says, out loud

Write both on your paper. Then write what each is. This pack is 300 g of zinc already in solution, made so it goes through the drip line or the watercourse without residue, or onto the leaf with a jug's measure, at the row the plan prints. Zinc sulfate is a general product and VAN prints no price for it. What the plan asks for is a rate in litres at a stage; this is the pack that rate is written in.

The fact behind it

- V-Zinc 3 L is 1,375 rupees; 20 L is 6,450; 200 L is 55,000 (farmer price sheet, Aug 2026).
- 100 g of zinc in every litre, 300 g in the 3 L pack (the declared analysis on the pack).
- Every V-Zinc programme row is written in the 3 L pack (the crop programmes on van.com.pk).
- Fully soluble, no residue in the tank or the emitter (VAN's product data).

Never say: “It gives you X more maunds” or a rupees-per-acre return. No yield figure exists for the product. No cost per gram of zinc against powder.

“The sugarcane row says 6¼ packs. That is nearly 19 litres and 8,600 rupees an acre.”

The dealer says, out loud

Yes, and that row is through the water at germination, which is why the rate is in kilograms and not grams: 1.875 kg of zinc into the wet root zone, once, for a crop that stands a year on ground that locks zinc. Buy it as 1 pack of 20 L, 6,450 rupees, and the acre is covered with a litre to spare. The same is true for hybrid rice and first-year banana. The spray rows on the pulses are 600 ml; that is the other end of the same product.

The fact behind it

- Sugarcane and hybrid rice: 6¼ packs of 3 L at germination, fertigation, which is 18.75 litres (the crop programmes on van.com.pk).
- $6\frac{1}{4} \times 1,375 = 8,594$ rupees in 3 L packs; 1 × 20 L pack is 6,450 (farmer price sheet, Aug 2026).
- $18.75 \text{ L} \times 100 \text{ g} = 1.875 \text{ kg}$ of zinc (the declared analysis).
- 59.0% of Punjab samples read low in zinc, and it falls as pH rises (the Punjab soil record).

Never say: “Halve it, the plan is generous.” The plan’s rate is the rate until VAN changes the row.

“Can I put it in the tank with my DAP water, or spray it with the phosphate?”

The dealer says, out loud

No. Zinc and a soluble phosphate in 1 tank make zinc phosphate, which does not dissolve. You lose the zinc, you lose the phosphate, and the drip line can block. Give the zinc its own irrigation or its own pass. The same chemistry is why years of heavy phosphate on a zinc-short soil make the zinc shortage worse.

The fact behind it

- Zinc phosphate is poorly soluble: zinc and a soluble phosphate in 1 tank drop out together (textbook chemistry).
- Zinc and phosphorus pull against each other in the soil; high pH locks zinc the same way it locks phosphate (VAN's 17-nutrients page).
- Every V-Zinc row is its own pass: fertigation or spray, no tank partner named (the crop programmes on van.com.pk).

Never say: “Stir it well and it is fine.”

“Is this the chelated zinc? I was told chelate is what works on our soil.”

The dealer says, out loud

No. V-Zinc 10% is zinc sulfate, as the registered analysis says. VAN's chelated zinc is a separate product for partners, and I will not sell you one under the other's name. What the programme does with the sulfate is put it in solution, in the water or on the leaf, at germination, so it reaches the root zone or the leaf as zinc the crop can take. Follow the row for your crop.

The fact behind it

- V-Zinc 10% is registered as zinc sulfate, 10% w/v (the V-Zinc page on van.com.pk).
- VAN's chelated zinc is a separate partner product with its own specification (VAN's product data).
- The sulfate is fertigated on 11 of the 14 V-Zinc rows (the crop programmes on van.com.pk).

Never say: “It is as good as a chelate” or “it is a chelate”. Neither is on VAN's record for this product.

“My crop is already showing it. Will a spray now fix it?”

The dealer says, out loud

A spray reaches the leaf directly and is the quickest zinc a standing crop can get, so put the plan's spray on now where a spray row exists. But the size the plant has already made itself, it keeps: zinc at flowering corrects a shortage that has already decided the plant. Next season, the row is at germination, through the water, before the sign shows. VAN prints no recovery figure and no day count.

The fact behind it

- VAN names germination and early growth as the stages for V-Zinc (the V-Zinc page on van.com.pk).
- Zinc decides plant height, leaf size and, in rice and wheat, grain set (VAN's 17-nutrients page).
- The spray rows are chickpea, lentil and mungbean at early growth, $\frac{1}{5}$ pack (the crop programmes on van.com.pk).

Never say: “It greens up in 3 days” or “it recovers the yield”.

“Which stage, and how much?”

The dealer says, out loud

What the plan prints, in 3 L packs. Sugarcane and hybrid rice: 6¼ packs at germination, through the water. Tomato, turmeric and banana: 4¼ packs at germination; banana again, 2 packs, at grand growth. Mango: 2 packs at early growth. Strawberry: 2 packs at germination. Soybean: ½ pack at early growth. Chickpea, lentil and mungbean: ⅓ pack, 600 ml, sprayed at early growth. Wheat, maize, cotton and potato carry V-Transform, the granule, on their rows.

The fact behind it

- 12 programmes name V-Zinc, 14 rows, all in the 3 L pack (the crop programmes on van.com.pk).
- Germination on sugarcane, hybrid rice, tomato, turmeric, strawberry and banana; early growth on mango, soybean and the pulses (the same programmes).
- Wheat, maize, cotton, potato, basmati rice, chili, onion and citrus carry the granule, V-Transform, on their rows (the same programmes).

Never say: “More packs, more yield”, or a rate for a crop with no row.

“Can I put it in my drone?”

The dealer says, out loud

Not from this pack at this rate. VAN flies a drone grade of V-Zinc, and the site says so, but a drone tank is 20 litres and the concentration on the leaf is a different specification with its own rate. Ask VAN for the drone rate; I will not read one off the fertigation pack.

The fact behind it

- A drone and ultra-low-volume grade of V-Zinc is in production under the same name (the application-systems page on van.com.pk).
- A drone tank carries about 20 litres; everything the crop gets that day is dissolved in it (the same page).
- The fertigation and spray rows are written for the 3 L pack in the watercourse or the knapsack; the drone grade has its own rate, from VAN.

Never say: “Use the 3 L pack in the drone.” No drone rate from this deck.

“Is it registered? What is the licence?”

The dealer says, out loud

Pakistan Standard PS 5469-2020 for liquid nutrient supplements, manufacturing licence CM/L-3130/2024, VAN as the registered maker. Every batch is tested at VAN Lab, PNAC LAB 336, before it ships. Read the batch number off the pack and VAN sends you that batch’s certificate, free.

The fact behind it

- V-Zinc 10%: PS 5469-2020, manufacturing licence CM/L-3130/2024 (the regulatory table on van.com.pk, from the PSQCA master record).
- The licence number is printed on the pack; the number is what a dealer quotes, never an expiry date.
- Every batch is released through VAN Lab, PNAC LAB 336, ISO/IEC 17025:2017 (VAN’s quality page).

Never say: An expiry date. The number is what a dealer quotes.

V-Zinc 10% in the published programmes, per acre.

Crop	Stage	Rate per acre	Method	Pack
Sugarcane, February planting	Germination	6¼ pack	Fertigation	3 L
Hybrid Rice	Germination	6¼ pack	Fertigation	3 L
Tomato	Germination	4¼ pack	Fertigation	3 L
Turmeric	Germination	4¼ pack	Fertigation	3 L
Banana, 1st year	Germination	4¼ pack	Fertigation	3 L
Banana, 1st year	Grand Growth	2 pack	Fertigation	3 L
Banana, 2nd year	Germination	4¼ pack	Fertigation	3 L

Rows as published in van.com.pk's crop programmes, all 12 programmes that name V-Zinc, 14 rows, every row in the 3 L pack; fertigation on 11 rows, spray on the 3 pulses. A rate is per acre; the crop page scales it to the field.

V-Zinc 10% in the published programmes, continued.

Crop	Stage	Rate per acre	Method	Pack
Banana, 2nd year	Grand Growth	4¼ pack	Fertigation	3 L
Mango	Early Growth	2 pack	Fertigation	3 L
Strawberry	Germination	2 pack	Fertigation	3 L
Soybean	Early Growth	½ pack	Fertigation	3 L
Chickpea	Early Growth	⅓ pack	Spray	3 L
Lentil	Early Growth	1/5 pack	Spray	3 L
Mungbean & Mash	Early Growth	1/5 pack	Spray	3 L

Rows as published in van.com.pk's crop programmes, all 12 programmes that name V-Zinc, 14 rows, every row in the 3 L pack; fertigation on 11 rows, spray on the 3 pulses. A rate is per acre; the crop page scales it to the field.

WHAT VAN WILL NOT CLAIM FOR IT

A dealer who says any of these is speaking for himself, not for VAN.

1

A yield figure, a grain-zinc figure or a human-nutrition claim. No V-Zinc trial exists; the published wheat responses and the National Nutrition Survey describe zinc, and were measured by someone else.

2

That 64% of Pakistan's soils, or 57% of Punjab's, are zinc-deficient, until a source is on file. The survey's 59.0% below 1.0 ppm is the figure a dealer may say.

3

That it is chelated, or as good as a chelate. It is zinc sulfate, as registered; the chelate is a separate product.

4

A 1 L foliar pack with iron, amino acids and seaweed. It is off the price sheet and off this deck until VAN confirms it.

5

A drone rate, or a fertigation or spray rate the plan does not print, as if it were a programme figure.

6

That it greens a crop in X days, or recovers a plant that has already stayed small.

Every batch is tested. The bag carries the proof.

1 · The batch number

It is printed on the bag. Read it to the grower and show him where it is. Every bag of every batch carries one.

2 · The certificate of analysis

For any batch, free on request. Send the batch number off the bag to kisan@van.com.pk or the helpline, and the certificate for that batch comes back. No sample to post.

3 · The laboratory

VAN Lab, PNAC LAB 336, accredited to ISO/IEC 17025:2017. Every batch is released through it before it ships. The certificate carries the laboratory's number.

What a certificate for V-Zinc 10% shows

The declared analysis tested for the batch: zinc against 10% w/v, with the batch number, the Pakistan Standard PS 5469-2020 and licence CM/L-3130/2024 on the pack. No certificate for a V-Zinc batch was on file for this deck, so no batch reading is printed here; the grower asks for his own batch's certificate.

The lines a dealer says in Urdu.

The first line is the promise word from the VAN brand master. The other 3 are the deck's key sentences, translated in a first pass and not yet reviewed by VAN. Say them, and send corrections to partner@van.com.pk.

Zinc. VAN has no promise word for it; a plain line.

Urdu first pass, unreviewed

زنک فصل کو قد دیتا ہے

Your soil has zinc and holds it back. So give it as a liquid, in the water or on the leaf.

Urdu first pass, unreviewed

زمین میں زنک ہے مگر روکا ہوا ہے، اس لیے پانی میں یا پتے پر ملا دیں

Give it at germination, when the plant is deciding its size.

Urdu first pass, unreviewed

اُگاؤ پر دیں، جب پودا اپنا قد طے کر رہا ہو

Never in the same tank as phosphate.
